Permit No. PKG21-0490

Subject: Response to County of Orange Geotechnical Review Comments Pertaining to Precise Grading Plans, Dana Point Harbor Revitalization, Buildings 1 through 12, Commercial Component, City of Dana Point, California

References: Listed on Page 12

Dear Mr. Ward:

This correspondence presents our response to the reference (1) County of Orange Review Comments, attached to this response as Appendix A, pertaining to the submittal of the precise grading plans and details for the subject site.

RESPONSES TO GEOTECHNICAL COMMENTS

RESPONSE TO COMMENT 1.001

Geotechnical consultant must review the Precise Grading Plans and applicable details submitted to the County that will be utilized during construction of the project. Provide additional geotechnical recommendations as necessary. The approved precise grading plans and applicable details must be reviewed and signed/stamped by the geotechnical engineer and engineering geologist prior to permit issuance. Note – The currently submitted precise grading plans are incomplete and do not include the recommended Deep Soil Mixing (DSM) and Load Transfer Platform (LTP) ground improvement plans/details. Please coordinate w/ project team to ensure the geotechnical ground improvement recommendations/details are included as part of the project precise grading plans.

Acknowledged. The final precise grading plans and applicable details will be reviewed from a geotechnical perspective and signed. We will coordinate w/ project team to ensure the AGI DSM and LTP geotechnical ground improvement recommendations/details are included as part of the project precise grading plans as “For Reference Only”.

Hadi Tabatabaee
BUILDING OFFICIAL

RESPONSE TO COMMENT 1.002

Multiple Building Permits and Plans (Commercial Core Buildings, site walls/retaining walls, etc.) are required for completion of this project. The approved project building and structural plans and applicable details must be reviewed and signed/stamped by the project geotechnical engineer and engineering geologist prior to the applicable permit issuance.

Acknowledged. The approved project building and structural plans and applicable details will be reviewed from a geotechnical perspective and signed/stamped.

RESPONSE TO COMMENT 1.003

The approved Ground Improvement Plans (Deep Soil Mixing (DSM) and Load Transfer Platform (LTP)) and details (from GRD21-0090) must be included as a reference in the approved project building and structural plan sets.

Acknowledged. AGI sheets GI-1 through GI-5 will be included in the building and structural plan sets as reference only.

RESPONSE TO COMMENT 1.004

The submitted geotechnical report (GMU Geotechnical, Inc., dated 5/27/21) indicates that liquefaction analysis was performed on the SPT exploratory data as a cross-check to the CPT liquefaction analysis and yielded similar results. Please provide a copy of the completed SPT liquefaction analysis as discussed in the submitted report. Provide additional recommendations as needed.

Results of the liquefaction analysis performed on SPT data of six (6) exploratory borings (DH-12, DH-17, DH-18, DH-19, DH-26, DH-51) are included as Appendix B. As stated in the submitted geotechnical report, CPT-based liquefaction analyses provide a more reliable, accurate and continuous database from which to calculate liquefaction magnitude. The SPT-based analysis was generally consistent with the results of the CPT-based analysis, but it does include a few isolated cases indicating a larger magnitude of settlement, which is not uncommon using SPT-based analysis. We do not believe these aberrations are accurate predictions of the expected earthquake-induced settlements under the considered ground motions.

RESPONSE TO COMMENT 1.005

Provide additional comment/discussion to confirm the geotechnical recommendations with respects to infiltration design and bioretention areas from the submitted project geotechnical report (GMU, Inc., report dated 5/27/21) have been incorporated into the submitted project plans. Provide additional recommendations as necessary.

The typical modular wetland systems (precast concrete structures) detailed in the submitted project plans are completely impermeable (confirmed by Tait), and satisfy the geotechnical recommendations provided.

RESPONSE TO COMMENT 1.006

At a minimum, the geotechnical site drainage recommendations should be in accordance with CBC requirements. Please confirm the report recommendations for site drainage are in accordance with CBC requirements and that the submitted project plans have incorporated your geotechnical recommendations. Provide additional geotechnical site drainage recommendations as necessary.

Page 31 of our report recommends that positive drainage of at least 2% away from the perimeters of the structures and site pavements should be incorporated into the design. The submitted project plans generally meet this recommendation. Tait Engineering should verify that site drainage is in conformance with 2019 CBC requirements beyond the recommendations within our report.

RESPONSE TO COMMENT 1.007

The submitted geotechnical report (GMU Geotechnical, Inc., dated 5/27/21) indicates groundwater is anticipated to impact DSM columns and deep utility excavations. Please provide additional comment/discussion to confirm geotechnical recommendations to mitigate groundwater impact on construction based on review of the currently submitted project plans. Also provide comment/discussion to confirm project dewatering operations anticipated means of disposing of pumped water. Provide additional recommendations as necessary.

Shallow groundwater a common condition in projects including DSM construction is not expected to impact the DSM construction process. The DSM construction process consists of advancing a hollow stem into the ground while rotating mixing blades assist advancement by loosening the soil. As the hollow stem is advanced into and ultimately withdrawn from the DSM column location under construction, a grout slurry (consisting of cement and water) is pumped through the tip of the tooling. The rotation of the mixing blades on the tooling aim to homogenize a "soilcrete" mixture of the in-situ soils and the injected grout. Because the on-site soils are mixed-in-place, no

APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works. OC Development Services of Orange County. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

"open holes" are ever created, eliminating the concerns for caving soils which can be caused by shallow groundwater when using other geotechnical construction processes (drilled shafts, micropiles, etc.).
The DSM construction process will generate spoils of the "soilcrete" mixture, which are to be mixed with site soils and processed for use as onsite fill after curing, or potentially incorporated into the proposed LTP. The DSM construction process will not generate any pumped water requiring disposal.

The project general contractor, Snyder Langston, is in the process of applying for a groundwater discharge permit and will be responsible for storage and disposal of any pumped groundwater, which may be required during excavation and installation of site utilities.

RESPONSE TO COMMENT 1.008

The submitted geotechnical report (GMU Geotechnical, Inc., dated 5/27/21) indicates estimated groundwater levels based on high tides were determined and provided in an effort to aid the project in designing underground utilities and give contractors an idea of what conditions may be encountered. Please provide additional comment/discussion on historic high groundwater elevation and high tide groundwater elevation with respects to the project stability analyses included in the submitted project documents (GMU and AGI). Provide additional data and/or updated analysis as necessary. Provide additional recommendations as necessary.

Attached as Appendix G are additional stability/lateral spread analyses of the AGI design with a groundwater level of 5' below ground surface (in reference to ground surface at the time of the investigations, and not of proposed ground surface) as described in our report, which is based on historic high groundwater at the project site. The high tide groundwater elevations shown on Plate 5 are intended to aid underground utility design and to provide estimated groundwater levels that may be encountered by contractors, but not for use in stability analyses.

The results of these additional AGI analyses do not substantially change the results (in fact the maximum estimated slope deformations in these additional analyses is 0.1" **less** than the previously provided values), and as such there is no impact on the AGI design.

In addition, the following additional items should be noted: 1) only the AGI analysis is relevant for the proposed conditions as the GMU analyses simply identified the need for lateral spreading mitigation, 2) the lateral spreading mitigation is based on an MCE earthquake which is an earthquake with a return period of 2500 years, 3) the mitigation is extremely robust.

BUILDING OFFICIAL

RESPONSE TO COMMENT 1.009

The submitted geotechnical report indicates the lateral extents of the subsurface riprap in the vicinity of the proposed buttress DSM columns is uncertain and that areas of rip rap may be encountered during construction. Please provide additional comment/discussion on the potential impact of greater than anticipated rip rap section in this area on the proposed buttress DSM column construction and layout/design, including minimum 4-foot embedment into bedrock. Provide additional recommendations as necessary.

The DSM configuration included an approximately 20-feet offset from the quay walls to the nearest DSM elements. The as-built details of the quay walls provided, namely Sections A and B of Sheet 23 (by Koebig & Koebig, Inc., attached as Appendix C) indicate that the DSM column locations as configured are laterally at least 15' clear of any placed riprap/revetment stone, and will be installed through compacted fill. The 20-feet offset was intended as a conservative buffer in the event that the actual limits of placed rip rap differ from the as-built drawings.

AGI has provided an exhibit, attached as Appendix D, to illustrate potential mitigation options in the event that an isolated riprap obstruction is encountered.

RESPONSE TO COMMENT 1.01

Provide additional comment/discussion on the existing condition/performance of Buildings 2 through 5 at the subject site. Include confirmation of subsurface conditions/foundation conditions and proposed mitigation (i.e., no required mitigation/deep soil mixing columns/load transfer platform, etc.) for the proposed "minor improvements" as discussed in the submitted project geotechnical report (GMU Geotechnical, Inc., dated 5/27/21) and submitted project plans. Provide additional recommendations as necessary.

We understand that the renovation of Buildings 2-4, 5A and 5B will generally consist of remodeling the existing buildings (constructed in the early to mid-1970's) with new doors and windows and, on some of the buildings, removing some interior and exterior walls along with new interior slab-on-grade to reconstruct their layout. In addition, some ramp and stair footings will be included in the remodel.

These buildings have performed satisfactorily since the original development with no signs of visible or no reports of significant distress. Consequently, there is no practical or economically viable way to improve the resistance of these buildings to liquefaction related deformations. It is our understanding that based on meetings between the county and the design team and the developer at the start of 2020, there was agreement reached between all parties that the modifications to the existing buildings would not require anything beyond localized strengthening of existing framing, walls, and footings (i.e., the buildings would not be subject to

Hadi Tabatabaee
BUILDING OFFICIAL

2019 liquefaction criteria). However should the County require resistance to liquefaction related deformations, then these buildings would likely need to razed, ground improvement implemented and new foundations constructed.

RESPONSE TO COMMENT 1.011

Provide additional comment/discussion to confirm the basis of the geotechnical recommendations for allowable bearing value for the proposed project (i.e., 5,000 psf for Buildings 1 and 6-12 and 2,500 psf for Buildings 2-5). Specifically, address subsurface conditions, proposed mitigation, existing improvements and proposed improvements at the different locations/different allowable bearing recommendations. Include additional data (e.g. plot plan/map, subsurface data, analysis/evaluation, etc.) as necessary to support your comment/discussion. Provide additional recommendations as necessary.

The bearing value for Buildings 1 and 6-12 are based on the presence of DSM columns below the building foundations and slabs while the bearing value for Buildings 2-5 are based on locally "improved" existing soils (i.e., per our recommendations). Consequently, there is a significant difference between the two design bearing values. See AGI Calculations for DSM column supported bearing calculations (See Section 4.2 and Appendices C1 and C21 of the AGI submittal package).

RESPONSE TO COMMENT 1.012

The submitted geotechnical report (GMU Geotechnical, Inc., dated 5/27/21) discusses the anticipated ground improvement (i.e., deep soil mixing columns/load transfer platform) construction schedule and grading pad release for construction of the proposed structure(s). In addition to the information discussed in the submitted geotechnical report, the project will also be required to provide final letter/report from geotechnical consultant of record (GMU Geotechnical, Inc.) prior to pad release for construction to confirm the preliminary recommendation for allowable bearing value (5,000 psf) for the proposed structure(s) remains valid based on the as-graded building pad conditions and DSM/LTP installation.

Acknowledged. As-graded reports during construction will confirm the validity of the recommendation of the 5,000 psf allowable bearing value.

RESPONSE TO COMMENT 1.013

The project must update the AGI, Inc., Ground Improvement Plans General Notes and Details Section 3.4 Quality Control and Quality Assurance (Sheet GI-2) must be updated to include note that written confirmation from project geotechnical consultant of record will be provided upon completion of site grading and deep soil mixing columns/load transfer platform installation to confirm preliminary recommendation for proposed structure(s) allowable bearing value of 5,000 psf remains valid. Additional recommendations shall be provided as necessary.

Acknowledged. AGI sheet GI-2 has been revised to incorporate this note, within their updated design package, attached as Appendix E.

RESPONSE TO COMMENT 1.014

Provide additional comment/discussion on the lateral spread analysis presented in the GMU Geotechnical, Inc., report dated 5/27/21 (Appendix E). Please include confirmation of location cross-sections analyzed and additional discussion on data/input values utilized for analysis. Include additional data as necessary to support your comment/discussion. Provide additional recommendations as necessary.

The cross-section labels (A-A', C-C'), labeled on the second line in the top left of the analysis sheets, correspond to the cross-sections of the same labels on GMU Plates 2 and 3 (and also correspond to the AGI cross-sections.

The basic soil parameters (unit weight, cohesion', φ') used in the analyses were derived from the extensive lab testing performed on sampled site soils, and are intended to be conservative but representative values. GMU's liquefaction analysis evaluated both CPT data (Appendix D of our report) and SPT data (Appendix B of this letter) in order to A) identify the liquefiable zones under the design seismic loading, and B) estimate the residual shear strength of the liquefied zones post-earthquake. To provide clarity, these residual strengths of liquefied zones are labeled as:

- "Liquefied Su/Sig'v" in our CPT liquefaction analysis
- "S_r/σ'_{vo}" in our SPT liquefaction analysis
- "Tau/Sigma Ratio" in our lateral spread analyses
- "Vertical Strength Ratio" in AGI's lateral spread analyses

It should be noted that the GMU lateral spreading analyses simply concludes that remediation is required. The ground modification design is based upon the AGI analyses.

Hadi Tabatabaee
BUILDING OFFICIAL

RESPONSE TO COMMENT 1.015

Provide additional comment/discussion to confirm the location of the pseudostatic slope stability analysis cross-sections presented in Appendix B1 of the AGI, Inc., report dated 5/27/21. Provide updated Plates/Details as necessary to indicate the confirmed cross-section locations. Provide additional recommendations as necessary.

The cross sections AGI used in this analysis (Plate GI-5) correspond to the GMU cross-sections (Plate 2, 3). The sections are named in the bottom right corner of AGI's analysis sheets ("Section A" = the A-A' cross-section). AGI has incorporated additional section labels in the top left corners of the analysis sheets of their revised design package (Appendix E) for clarity.

RESPONSE TO COMMENT 1.016

Provide additional comment/discussion on the pseudostatic slope stability analysis presented in Appendix B1 of the AGI, Inc., report dated 5/27/21. Please include additional discussion on data/input values utilized for analysis, including Kh values, etc. Include additional data as necessary to support your comment/discussion. Provide additional recommendations as necessary.

Kh values were not selected parameters in AGI's analyses but rather result from AGI's analyses. Based on the site geometry, static loading conditions, and soil properties in the model, the Kh values were iterated until achieving a factor of safety result approximately equal to unity to represent the yield coefficient (Ky) value (by definition) for input into the lateral deformation analysis provided in Appendix B3 of the AGI design package.

RESPONSE TO COMMENT 1.017

Provide additional comment/discussion to confirm the geotechnical recommendation for the anticipated magnitude of vertical settlement (total and differential) that should be taken into account during design and construction of the proposed improvements at the completion of the proposed remedial grading/ground improvement operations. Include the geotechnical recommendation for the horizontal distance over which the anticipated magnitude of remaining vertical differential settlement will occur. Provide additional recommendations as necessary.

The magnitudes of settlement provided in the submitted geotechnical report for Buildings 1 and 6-12 were intended as conservative estimates. Actual estimated settlements as described in the AGI design submittal are 0.5" of static settlement and 0.1" of seismically induced settlement. It should also be noted that all foundations will be founded on DSM columns embedded into bedrock while the slab will be supported on a load transfer platform that is designed to span between the

Hadi Tabatabaee
BUILDING OFFICIAL

DSM columns. Consequently, the potential for significant adverse settlements to affect Buildings 1 and 6-12 are very small to negligible.

Static settlements for the minor improvements associated with Buildings 2-5 are contained in our report standard and minor – i.e., less than 1' total and ½ inch differential as long as our footing subgrade recommendations are followed. Seismic settlements and lateral deformations due to spreading will be significant (similar to those calculated for Buildings 1 and 6-12). It is our understanding that based on meetings between the county and the design team and the developer at the start of 2020, there was agreement reached between all parties that the modifications to the existing buildings would not require anything beyond localized strengthening of existing framing, walls, and footings (i.e., the buildings would not be subject to 2019 liquefaction criteria). However, if it is required by the County that in order to construct the minor modifications, that the buildings must be able to stand liquefaction related deformations, then the buildings will need to demolished and ground improvement as well as new foundations will be required.

RESPONSE TO COMMENT 1.018

Update/revise the geotechnical cross-sections and plan view exhibits from the GMU Geotechnical, Inc., report dated 5/27/21 and the AGI, Inc., Design Submittal Package (or provide new exhibits if preferred) to indicate the location/limit of the recommended Load Transfer Platform (LTP) beneath Buildings 1 and 6-12 at the subject project. Provide additional recommendations as necessary.

See Plates 2 and 3 for revised plan view and cross sections, attached as Appendix F.

RESPONSE TO COMMENT 1.019

Provide updated/additional geotechnical cross-section(s) as necessary based on your review of the currently submitted project plans and your responses the review comments contained herein. At a minimum, cross-section(s) should extend beyond property lines/limits of permit as necessary to accurately depict site conditions that may impact the proposed grading and construction. Cross-section/exhibit/detail should indicate the proposed site grading/improvements, as-graded site conditions/existing improvements, anticipated subsurface conditions (e.g., geologic contacts/structure, existing improvement foundations, etc.), and the geotechnical remedial grading/ground improvement, temporary excavation and foundation recommendations from your submitted report(s).

Cross section A-A' extends beyond property lines, and collectively the cross sections provided accurately depict site conditions that may impact the proposed grading and construction. The cross

1.006	Geotechnical Review- PKG21-0490 Ryan Rose	Geotechnical/Geology Check List	At a minimum, the geotechnical site drainage recommendations should be in accordance with CBC requirements. Please confirm the report recommendations for site drainage are in accordance with CBC requirements and that the submitted project plans have incorporated your geotechnical recommendations. Provide additional geotechnical site drainage recommendations as necessary.		Required	
1.007	Geotechnical Review- PKG21-0490 Ryan Rose	Geotechnical/Geology Check List	The submitted geotechnical report (GMU Geotechnical, Inc., dated 5/27/21) indicates groundwater is anticipated to impact DSM columns and deep utility excavations. Please provide additional comment/discussion to confirm geotechnical recommendations to mitigate groundwater impact on construction based on review of the currently submitted project plans. Also provide comment/discussion to confirm project dewatering operations anticipated means of disposing of pumped water. Provide additional recommendations as necessary.		Required	
1.008	Geotechnical Review- PKG21-0490 Ryan Rose	Geotechnical/Geology Check List	The submitted geotechnical report (GMU Geotechnical, Inc., dated 5/27/21) indicates estimated groundwater levels based on high tides were determined and provided in an effort to aid the project in designing underground utilities and give contractors an idea of what conditions may be encountered. Please provide additional comment/discussion on historic high groundwater elevation and high tide groundwater elevation with respects to the project stability analyses included in the		Required

			submitted project documents (GMU and AGI). Provide additional data and/or updated analysis as necessary. Provide additional recommendations as necessary.			
1.009	Geotechnical Review-PKG21-0490 Ryan Rose	Geotechnical/Geology Check List	The submitted geotechnical report indicates the lateral extents of the subsurface riprap in the vicinity of the proposed buttress DSM columns is uncertain and that areas of rip rap may be encountered during construction. Please provide additional comment/discussion on the potential impact of greater than anticipated rip rap section in this area on the proposed buttress DSM column construction and layout/design, including minimum 4-foot embedment into bedrock. Provide additional recommendations as necessary.		Required	
1.01	Geotechnical Review-PKG21-0490 Ryan Rose	Geotechnical/Geology Check List	Provide additional comment/discussion on the existing condition/performance of Buildings 2 through 5 at the subject site. Include confirmation of subsurface conditions/foundation conditions and proposed mitigation (i.e. no required mitigation/deep soil mixing columns/load transfer platform, etc.) for the proposed “minor improvements” as discussed in the submitted project geotechnical report (GMU Geotechnical, Inc., dated 5/27/21) and submitted project plans. Provide additional recommendations as necessary.		Required	
1.011	Geotechnical Review-PKG21-0490 Ryan Rose	Geotechnical/Geology Check List	Provide additional comment/discussion to confirm the basis of the geotechnical recommendations for allowable bearing value for the proposed project (i.e. 5,000 psf for Buildings 1 and 6-12 and 2,500 psf		Required

SECTION OR DETAIL IDENTIFICATION
A / 2 — SHEET ON WHICH SECTION OR DETAIL IS REFERENCED
DRAWING ON WHICH SECTION OR DETAIL APPEARS

GENERAL NOTES

1. STATIONS INDICATED ON ROAD PLAN AND PROFILE ARE MEASURED ALONG CENTERLINE.
2. THE CONTRACTOR SHALL DEWATER THE CONSTRUCTION AREA AS INDICATED AND SPECIFIED. IT IS IMPERATIVE THAT THE AREA SURROUNDING AND INCLUDING THE BOAT RAMP BE COMPLETED WITHIN 240 DAYS AFTER AWARD OF CONTRACT, AS INDICATED ON SHEET 8 OF THESE DRAWINGS. AT THIS TIME ALL CONSTRUCTION IN THE DESIGNATED AREA SHALL BE COMPLETE AND THE AREA SHALL BE TURNED OVER TO THE ORANGE COUNTY HARBOR DISTRICT, TOGETHER WITH THE SOUTHEASTERLY 50 FEET OF DEL OBISPO STREET FROM PACIFIC COAST HIGHWAY TO STATION 84 + 00
3. THE LOWER LIMITS OF BOTH CONCRETE AND STONE REVETTED SLOPES HAVE BEEN INDICATED HEREIN BASED ON THE INFORMATION AVAILABLE. HOWEVER, BECAUSE THE LIMITS ARE DEPENDENT ON THE DEPTH OF THE NATURAL FORMATION, THE ACTUAL LOCATION OF THE LOWER LIMITS WILL BE FIELD-DETERMINED DURING CONSTRUCTION IN ACCORDANCE WITH THE REQUIREMENTS OF SECTIONS A/23, B/23, C/23, D/23, E/23, C/26 & D/26
4. ALL COORDINATES, GRID LINES, AND BEARINGS SHOWN ON THESE DRAWINGS ARE BASED ON THE HARBOR GRID SYSTEM EXCEPT WHEN OTHERWISE NOTED. THE HARBOR GRID IS BASED UPON THE BEARING OF THE LONGEST SECTION OF THE WEST BREAKWATER, WHICH IS S. 73° 40' E. ON THE LAMBERT SYSTEM, BUT WHICH IS ARBITRARILY TAKEN AS DUE EAST ON THE HARBOR GRID. THE ORIGIN OF THE HARBOR GRID SYSTEM IS SUCH THAT THE NORTHERLY LIMIT OF THE BOAT BASINS IS EXACTLY N. 2000, WHILE THE CENTERLINE OF THE CAUSEWAY AND BRIDGE IS EXACTLY E. 8050. THE ORIGIN OF THE HARBOR GRID, IN TERMS OF LAMBERT COORDINATES, IS N. 474,520.932 AND E. 1,550,090.335.
5. ALL ELEVATIONS HEREIN ARE BASED ON MEAN LOWER LOW WATER (MLLW) DATUM. PROJECT BENCH MARK IS CALIFORNIA STATE LAND COMMISSION MONUMENT B-4061, ELEVATION 15.75, LOCATED ON THE SOUTHWESTERLY SIDE OF THE RAMP ONTO THE EXISTING DANA POINT PIER.
6. THE TERMS "REQUIRED BASIN DEPTH" AND "EXCAVATE TO - 8" (OR - 10 OR - 12), MEAN THAT THE MINIMUM ACCEPTABLE DEPTH IS THE ELEVATION SHOWN. DEEPER AREAS SHALL REMAIN AT NATURAL DEPTH. PINNACLES IN DEEPER AREAS, WHICH PROJECT ABOVE THE REQUIRED MINIMUM, SHALL BE REMOVED TO THE INDICATED DEPTH. OVER EXCAVATION OF NOT MORE THAN ONE FOOT IN WATER AREAS WILL BE PERMITTED.
7. IN AREAS WHERE CONCRETE OR OTHER CONSTRUCTION IS TO BE PLACED ON CUT SURFACES OF NATURAL FORMATION, OVER EXCAVATED AREAS SHALL BE FILLED WITH THE MATERIAL OF WHICH THE OVERLYING CONSTRUCTION IS COMPOSED.
8. UNLESS OTHERWISE INDICATED, THE NORTH ARROWS SHOWN HEREIN REFER TO HARBOR GRID NORTH

GENERAL NOTES

1. DESIGN CRITERIA FOR THE PRESTRESSED BOX GIRDERS: DESIGN, MATERIAL AND CONSTRUCTION: A.A.S.H.O. 1965
2. CONCRETE SHALL BE TYPE II PORTLAND CEMENT WITH 3/4" MAXIMUM SIZE OF AGGREGATE AND MAXIMUM SLUMP OF 3" AND SHALL HAVE A MINIMUM STRENGTH AT 28 DAYS AS FOLLOWS:
   a) BOX GIRDERS f'_c = 5000 PSI, WITH NOT LESS THAN 7 1/2 SACKS OF CEMENT PER CUBIC YARD. AT TRANSFER f'_{ci} = 5000 PSI.
   b) SIDEWALKS, PAVEMENTS, BENTS, FOOTINGS AND APPROACH STRUCTURES; f'_c = 4500 PSI, WITH NOT LESS THAN 7 SACKS OF CEMENT PER CUBIC YARD. USE PLASTIMENT OR EQUAL CONCRETE DENSIFIER AS PER MANUFACTURER'S INSTRUCTIONS.
3. PRETENSIONING STEEL SHALL BE SEVEN-WIRE STRESS RELIEVED STRAND, UNCOATED, 270 KSI CONFORMING TO ASTM A-416 - PCST TENSIONING WILL NOT BE PERMITTED.
4. REINFORCING STEEL SHALL BE INTERMEDIATE GRADE DEFORMED BARS IN ACCORDANCE WITH ASTM SPECIFICATIONS A-15 AND A-305.
5. ELASTOMERIC BEARING PADS; AS PER A.A.S.H.O. SPECIFICATION, ARTICLE 1.7.51 - 50 DUROMETER HARDNESS.
6. EPOXY GROUT SHALL BE FURANE EPOCAST 530-2 OR EQUAL AND SHALL BE USED AS PER MANUFACTURER'S RECOMMENDATIONS.
7. THE TOP OF BOX GIRDERS AND FOOTINGS SHALL HAVE WOOD FLOAT ROUGH FINISH.
8. CHAMFER OR ROUND TO 3/4" RADIUS ALL EXPOSED CORNERS UNLESS OTHERWISE NOTED.
9. THE BEARING AREA VARIATION FROM PLANE SURFACE SHALL NOT EXCEED 1/16 INCH.
10. DIMENSIONS RELATING TO REINFORCING STEEL ARE TO CENTER OF BARS UNLESS OTHERWISE NOTED.
11. IN HANDLING BOX GIRDERS, THEY MUST BE MAINTAINED IN HORIZONTAL POSITION WITH LIFTING HOOKS UPRIGHT AT ALL TIMES AND MUST BE PICKED UP USING THE LIFTING HOOKS.

NOTES: PRECAST OR POURED IN PLACE WALLS

1. FOOTING SHALL HAVE CONSTRUCTION JOINTS AT 40'-0" O.C.
2. PRECAST & POURED IN PLACE CONCRETE SHALL HAVE ULTIMATE COMPRESSIVE STRENGTH OF 3,500 P.S.I. @ 28 DAYS WITH NOT LESS THAN 6 SACKS / YARD WITH 4" SLUMP MAXIMUM.
3. REINFORCING STEEL SHALL BE INTERMEDIATE GRADE BILLET STEEL BARS AS PER A.S.T.M. A-15 & DEFORMATIONS AS PER A.S.T.M. A305.
4. CONTRACTOR SHALL SUBMIT SHOP & ERECTION DRAWINGS FOR ALL PRECAST CONCRETE MEMBERS AND SHALL FURNISH CALCULATIONS SHOWING THAT THE PICK-UP POINTS AS DETAILED WILL NOT PRODUCE UNDUE STRESS IN THE MEMBER.
5. DIMENSIONAL TOLERANCES: PRECAST UNITS AS INSTALLED, SHALL CONFORM TO A.C.I. 525-1.

GENERAL NOTES

All grading shall be performed generally in accordance with these plans, the specifications, soils and geological report and the general requirements of the Orange County Grading Division.

All grading shall be performed generally in accordance with the plan intent ing." It is intended that each terrace or bench be co pleted in accordance with the plan and finished in such a condition that positive drainage and minimum erosion in accordance with the intent of the plan, the basic requirements of the Orange County Grading Divisio and the owner.

In the final stage of grading, the last bench or terrace cannot be co pleted with the plan, the site shall be left in a condition acceptable to the County Grading Division and the owner.

There is no intent to place any onsite fills for the development of the property. If, for the convenience of Contractor or others, onsite fills are made they shall be placed in accordance with the specifications and requirements of the Grading Division or removed after work has been completed.

Any modification or change in the plan which is necessary because of field conditions or construction procedures shall first be approved by the owner or his representative.

This grading plan was prepared to conform to a concept development plan prepared for the property by Adrian Wilson Associates.

1.0 INTRODUCTION

Advanced Geosolutions, Inc. (AGI) is pleased to present this design submittal package for deep soil mixing (DSM) at the planned redevelopment area located at the harbor in Dana Point, California. We understand the redevelopment involves the construction of new hotels, new commercial buildings and new marine facilities. The submittal herein addresses the design for the commercial area of this redevelopment.

The geotechnical report by GMU identifies medium dense to dense sandy artificial fill at the site down to a depth of approximately 20 feet below grade at the time of geotechnical exploration. They recommended ground improvement to mitigate excessive seismically induced lateral spreading at the project site. Ground improvement is also intended to mitigate uncertainty about the competence of the undocumented artificial fill soils and the potential associated risk with constructing structures overlying those materials. DSM was selected by the design team as the most appropriate ground improvement technique for this project based on the soil conditions, performance goals, efficiency, and site constraints.

Our design meets the performance criteria as described in the following sections. Concepts, calculations, means, and methods in this design are deemed intellectual property of AGI, and shall remain confidential. AGI's design, and any other related information, shall not be made available to another party other than the members of the design team without the express written consent of AGI. We anticipate that a set of construction drawings and specifications will be put out to bid but only the minimal set of documents required to bid the installation work should be distributed to bidders as approved by AGI.

2.0 REFERENCE DOCUMENTS AND INFORMATION

In preparing this design AGI relied on information provided by the design team, including:

- Geotechnical Investigation Report, Volumes 1, 2, and 3, Dana Point Harbor Revitalization: Buildings 1 through 12 – Commercial Component, City of Dana Point, California. Report no. 17-206-02 prepared by GMU and dated 5/27/2021.
- Site plan CAD file provided by GMU
- Foundation plan for building 1 prepared by KPFF dated 10/8/2020
- Foundation plans for buildings 6-9 prepared by KPFF dated 4/9/2021
- Foundation plans for building 10-12 prepared by KPFF dated 4/12/2021

3.0 DESIGN CRITERIA

Per the Geotech report's recommendation and discussion with the design team, the ground improvement shall be designed in consideration of the following performance criteria:

- Design earthquake Magnitude (Mw) = 6.9 and PGA = 0.67g

Building&Safety: Ryan Rose 12/11/2023
Approval: Geotechnical Reports
Permits: GRD21-0090

County of Orange - OC Public Works
Development Services
APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works/ OC Development Services of Orange County. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

- Reduce lateral spread movement to 3 inches or less behind the DSM buttress
- Ground improvement will directly support all footings with at least 5,000 psf allowable bearing pressure.
- Limit total static settlement to 1 inch or less.
- Reduce total seismic settlement to 0.5 inch or less.
- Building slab-on-grade areas require improvement or support to mitigate potential poor performance of undocumented fill materials.

4.0 CEMENT DEEP SOIL MIXING (DSM) DESIGN

The proposed DSM layout is presented in Appendix A. The DSM program includes two components: (1) DSM buttress along the waterfront, between the existing seawall and the proposed building, and (2) discrete DSM columns under the proposed buildings to support structural loads with a soil-cement load transfer platform (LTP) to distribute slab loading to the DSM columns.

The buttress is 12 feet wide and consists of overlapping 6-ft diameter DSM with a continuous front row. The columns will embed 4 feet into the Capistrano formation.

The DSM system supporting Buildings 6 through 12 consists of 4-ft diameter columns centered under all footings. In addition, the same 4-ft diameter columns are installed in a 12-ft grid pattern throughout slab-on-grade areas in building interiors. The 4-ft diameter DSM columns for building support will extend to practical refusal to rest on competent bedrock materials.

The DSM design unconfined compressive strength (UCS) is 150 psi at 28 days.

4.1 Lateral Spread

AGI performed a pseudostatic slope stability analysis in order to determine the post-improvement critical horizontal seismic coefficient (also called yield acceleration, k_y), which is a necessary input value to estimate lateral slope deformation. The analysis is presented in Appendix B1. The slope geometry and soils parameters used in the model were provided by GMU.

For section A, the composite shear strength of the DSM buttress was calculated based on the area replacement ratio (ARR), and this calculation is shown in Appendix B2. For sections C and D, the DSM block is modeled as a 5-ft wide (effective width) zone with 100% ARR on the perimeter of Building 1, while the soils inside the block is assigned unimproved strength without liquefaction.

AGI estimated lateral spread deformation using the empirical equations outlined in NCHRP Report 611 (2008), and the calculation is shown in Appendix B3. The results are summarized in Table 1 below.

Building&Safety: Ryan Rose 12/11/2023
Approval: Geotechnical Reports
Permits: GRD21-0090

County of Orange - OC Public Works
Development Services
APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works/ OC Development Services of Orange County. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

Table 1. Estimated Post-improvement Slope Deformation

Section	Ky from pseudostatic analysis	Estimated Slope deformation (inch)
Section A	0.26g	1.4
Section C	0.78g	0.0
Section D	0.49g	0.1

AGI performed all applicable internal stability checks of the buttress in accordance with FHWA guidelines. Those checks included bearing capacity, overturning, crushing at the toe, racking, and internal shear failures. The analysis is included in appendix B4.

4.2 Building Support

The structural capacity and geotechnical capacity calculation are included in Appendix C1 and C2, respectively. The analysis results indicate that the allowable load on a 4-ft diameter DSM column bearing on bedrock is 200 kips.

Building loading information was not provided with the structural drawings but we understand the footings were sized for 5,000 psf. Therefore the required number of DSM column supporting each footing was determined by taking the footing area, multiply by 5.0 ksf, and divide by 200 kips.

4.3 Static Settlement

Since the DSM columns will bear directly on formation material, the main source of static settlement is the elastic compression of the soil cement. This was calculated using the software RSPile by Rocscience. The calculation is shown in Appendix C3. The elastic modulus of DSM material was selected based on FHWA's recommended correlation (300 times design compressive strength).

The result indicates static settlement of the DSM column under design load is approximately 0.5 inch.

4.4 Seismic Settlement

The DSM columns transfer building loads to bedrock, but it does not densify the surrounding soils. When the soils liquefy after an earthquake, it would induce downdrag forces on the DSM columns which causes additional compression and settlement.

AGI estimated the magnitude of liquefaction-induced downdrag and column compression using method for piles, as outlined in the AASHTO Bridge Design Manual. This calculation is shown in Appendix D, which shows that downdrag force is approximately 128 kips for a 4-ft diameter

Building&Safety: Ryan Rose 12/11/2023
Approval: Geotechnical Reports
Permits: GRD21-0090

County of Orange - OC Public Works
Development Services
APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works/ OC Development Services of Orange County. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

column. And the corresponding seismic settlement due to DSM column compression is less than 0.1 inch.

The structural capacity and geotechnical capacity checks of Appendices C1 and C2 also ensure that the DSM column can resist this downdrag load in addition to the building design load.

5.0 DSM INSTALLATION METHOD

Cement Deep Soil Mixing is performed using a specialty, purpose-built drilling tool consisting of a series of mixing blades and/or paddles extending radially from a hollow stem. In general, as the mixing tool is advanced into the soil, the hollow stem is used as a conduit to pump grout slurry (a mixture of cement and water) and injected at the tip of the tool while blending the soils. Pre-augering or trenching operations may be used to facilitate mechanical breakdown and blending of firm or stiff soils, or to remove the upper strata before DSM operations, or to assist with spoil control. The resulting DSM product is an improved soil-cement column with low compressibility, high stiffness, and significant load carrying capacity. Typical DSM equipment and mixing tools are shown below in Figure 1.

Grout will be batched on site using an in-line jet valve or weight control system. We anticipate that cement and water will be the only components for the grout slurry. Water and/or cement component quantities are adjusted to achieve the target specific gravity prior to pumping it to the mixing drill rig. The batch plant and pump are expected to be located in an area to avoid relocating the facility during the entire DSM operation.

Figure 1. DSM mixing tool assembly (left) and track-mounted drilling rig constructing a DSM column (right)

6.0 LOAD TRANSFER PLATFORM (LTP)

As described above the design includes a LTP consisting of cement-treated soils at the ground surface. The LTP will be constructed in three 12-inch-thick lifts for a three-foot-thick section of

Building&Safety: Ryan Rose 12/11/2023

The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

soil cement to a design strength of 200 psi at 28 days. LTP will be constructed after completion of the DSM scope placing the lifts over the top of the DSM columns throughout the structural footprints of the buildings. The LTP is designed to transfer load from the floor slab to the regularly spaced DSM columns at 12 feet on-center. See Geotechnical Report for other requirements.

We have assumed slab loading (Dead plus live) of 300 psf for this design. The performance of the LTP under load was analyzed using 2D plane strain finite element in PLAXIS, which is presented in Appendix E. The analysis demonstrates that the specified LTP will provide satisfactory performance under 300 psf floor load. The design also conservatively assumes that the artificial soils underlying the LTP may settle and accounts for the potential that a gap may form below the bottom of the LTP and the underlying soil such that no support is provided other than by the DSM columns.

7.0 DEEP SOIL MIXING QUALITY ASSURANCE / QUALITY CONTROL (QA/QC)

Quality Control / Quality Assurance will be performed in accordance with the DSM specifications as outlined on the approved drawings.

8.0 LOAD TRANSFER PLATFORM QUALITY CONTROL

LTP Quality Control will be performed in accordance with the Geotechnical Report's recommendations.

9.0 CONCLUDING REMARKS

This ground improvement preliminary design is submitted to address the geotechnical concerns of the proposed buildings. The design uses DSM ground improvement technique to meet the project requirements provided to AGI.

The layout of our ground improvement program is presented in AGI's shop drawing (Appendix A). Relevant strength parameters of the design will be verified by the UCS results.

This design was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the geotechnical engineering profession currently practicing under similar conditions and in the same locality. No warranty is made nor implied.

We appreciate the opportunity to provide our services for this project. Please contact the undersigned with any questions regarding this document.

PART 1 – GENERAL

1.1 SCOPE

A. DEEP SOILS MIXING (DSM) SHALL BE INSTALLED TO MITIGATE POTENTIAL FOR LATERAL SPREADING AND UNCERTAIN PERFORMANCE OF UNDOCUMENTED ARTIFICIAL FILL.

B. A LOAD TRANSFER PLATFORM (LTP) SHALL BE CONSTRUCTED THROUGHOUT ALL BUILDING FOOTPRINTS TO TRANSFER FLOOR SLAB LOADING TO UNDERLYING DSM COLUMNS AND PREVENT ADVERSE SETTLEMENT IN FLOOR SLAB AREAS THAT MAY RESULT FROM NEW LOADING APPLIED TO UNDERLYING UNDOCUMENTED ARTIFICIAL FILL.

C. THE DSM PLAN IS PREPARED IN ACCORDANCE WITH THE RECOMMENDATIONS OUTLINED IN THE GEOTECHNICAL REPORT PREPARED BY GMU DATED 5/27/2021.

D. THIS DESIGN IS BASED ON THE GEOTECHNICAL CHARACTERIZATION AND SOIL PARAMETERS PRESENTED IN THE REFERENCED GEOTECHNICAL REPORT, AS WELL AS LOAD REQUIREMENTS INDICATED ON THE STRUCTURAL DRAWINGS. THIS DESIGN WAS CONDUCTED IN A MANNER CONSISTENT WITH THE LEVEL OF CARE AND SKILL ORDINARILY EXERCISED BY MEMBERS OF THE GEOTECHNICAL ENGINEERING PROFESSION CURRENTLY PRACTICING UNDER SIMILAR CONDITIONS AND IN THE SAME LOCALITY. NO WARRANTY IS MADE NOR IMPLIED.

1.2 REFERENCES

A. GEOTECHNICAL INVESTIGATION REPORT, VOLUMES 1, 2, AND 3, DANA POINT HARBOR REVITALIZATION BUILDINGS 1 THROUGH 12, COMMERCIAL COMPONENT – REPORT NO. 17-206-02 PREPARED BY GMU DATED MAY 27, 2021.

B. ASTM C150 – SPECIFICATION FOR PORTLAND CEMENT

C. ASTM D1633 – STANDARD TEST METHODS FOR COMPRESSIVE STRENGTH OF MOLDED SOIL-CEMENT CYLINDERS

D. ASTM D4380 – DENSITY OF BENTONITE SLURRIES

F. FEDERAL HIGHWAY ADMINISTRATION DESIGN MANUAL: DEEP MIXING FOR EMBANKMENT, AND FOUNDATION SUPPORT, PUBLICATION NO. FHWA-HRT-13-046, OCTOBER 2013.

1.3 DEFINITIONS

A. DEEP SOIL MIXING (DSM) – A SOIL IMPROVEMENT TECHNIQUE USED TO CONSTRUCT IN SITU SOIL STRUCTURES OR TREAT SOILS IN PLACE, WITHOUT EXCAVATION OR DEWATERING. SOIL MIXING USES A LARGE, CRANE OR DRILL RIG – MOUNTED TURNTABLE TO INSERT A LARGE-DIAMETER (TYPICALLY 3- TO 8 -FOOT DIAMETER) TOOL INTO THE GROUND WHILE INJECTING AND MIXING A GROUT WITH THE SOIL. STABILIZED SOIL COLUMNS ARE CREATED THAT MAY BE JOINED TOGETHER BY OVERLAPPING TO FORM RETAINING WALLS OR FOUNDATION ELEMENTS, OR TO TREAT A LARGE BLOCK OF SOIL OR SLUDGE.

B. ASTM – ASTM INTERNATIONAL.

C. OWNER – THE OWNER AS REFERRED TO HEREIN IS DANA POINT HARBOR PARTNERS, LLC, C/O BURNHAM-WARD PROPERTIES.

D. ENGINEER – THE ENGINEER IS THE OWNER'S GEOTECHNICAL ENGINEER OF RECORD TO ACT ON ITS BEHALF IN THE EXECUTION OF THESE SPECIFICATIONS.

E. CONTRACTOR – REFERS TO THE GENERAL CONTRACTOR DIRECTLY CONTRACTED WITH THE OWNER AND SUBCONTRACTING THE DSM SCOPE TO THE DSM SUBCONTRACTOR.

F. DEEP SOIL MIXING SUBCONTRACTOR (DSM SUBCONTRACTOR) – AN INDIVIDUAL OR COMPANY WHO HAS HAD PROVEN AND SUCCESSFUL EXPERIENCE IN SOIL MIXING CONSTRUCTION.

G. GROUT – A STABLE COLLOIDAL SUSPENSION OF POWDERED CEMENT, BENTONITE, ADDITIVES AND/OR OTHER SIMILAR MATERIALS IN WATER. THE TERMS "GROUT" AND "SLURRY" ARE USED INTERCHANGEABLY IN THESE SPECIFICATIONS.

H. INJECTION RATIO – A VOLUMETRIC RATIO OF GROUT TO SOILS (E.G., 100 GALLONS/CUBIC YARD) TO BE MIXED IN A DSM COLUMN. THE GROUT INJECTION RATIO IS DETERMINED FOR EACH COLUMN BASED ON THE COLUMN DIMENSIONS, SOIL DENSITY, PATTERN OF TREATMENT, AND DESIRED APPLICATION RATE.

I. DSM COLUMN – ONE COMPLETED INSERTION, INJECTION AND MIXING OF THE SOIL WITH THE MIXING AUGER TO THE DESIGN DEPTH. THIS CREATES A COLUMN OF TREATED SOIL THE SAME DIAMETER AS THE MIXING AUGER. THE COLUMN MAY BE PRIMARY (THROUGH VIRGIN SOILS), SECONDARY (CONNECTING PRIMARY COLUMNS), TERTIARY, ETC.

J. WORKING PLATFORM – THE WORKING PLATFORM IS THE LEVELED AND STABLE SURFACE FROM WHICH THE DSM EQUIPMENT OPERATES.

K. MIXING AUGER/TOOL – THE SPECIAL TOOL THAT ATTACHES TO THE KELLY BAR AND IS INSERTED INTO THE GROUND TO MIX THE SOILS. THE TOOL MAY BE FITTED WITH PORTS FOR INJECTING GROUT, MIXING PADDLES, AUGER BLADES, ETC.

L. BLADE ROTATION NUMBER (BRN) – NUMBER OF BLADES X (RATE OF PENETRATION PLUS RATE OF WITHDRAWAL (IN REVOLUTIONS/METER). FOR EXAMPLE FOR 5 BLADES, RATE OF PENETRATION = 1 REVOLUTION/25 MM (40 REVOLUTIONS/M), AND RATE OF WITHDRAWAL = 1 REVOLUTION/20 MM (50 REVOLUTIONS/M), THE BRN = 5 X (40 + 50) = 450.

M. OBSTRUCTION – OBSTRUCTIONS ARE DEFINED AS MATERIALS CLASSIFIED AS UNDERGROUND UTILITIES, TREES (OR PARTS THEREOF), METAL, MAN-MADE OBJECTS, WOODEN/CONCRETE/STEEL OR ANY OTHER TYPE OF PILE OR DEEP FOUNDATION, OR NATURAL GROUND MATERIALS LARGER THAN A MAXIMUM COBBLE SIZE (8 INCHES MAXIMUM DIMENSION).

N. MIXING BLADE – A SINGLE MIXING BLADE SHALL CONSTITUTE A PAIR OF MIXING PADDLES ATTACHED TO THE SHAFT OF THE MIXING TOOL AT THE SAME ELEVATION. THE CUTTING PADDLES MAY ALSO BE CONSIDERED AS A MIXING BLADE.

O. DOSAGE – EXPRESSED AS THE MASS OF BINDER INTRODUCED PER VOLUME OF MIXED IN-SITU SOIL (E.G. KG/M^3).

1.4 SUBMITTALS

A. DSM WORK PLAN INCLUDING:

I. ASSIGNED NUMBER OF EACH COLUMN AS ID FOR INSTALLATION RECORD

II. NARRATIVE OF PLANNED MEANS AND METHODS TO EXECUTE THE INSTALLATION PER PLANS AND SPECIFICATIONS, INCLUDING SPECIFICATIONS OF THE GROUT BATCHING AND VERTICAL DRILL EQUIPMENT INTENDED FOR USE ON THE PROJECT.

III. NARRATIVE OF PLANNED MEANS AND METHODS TO EXECUTE THE QUALITY CONTROL REQUIREMENTS PER PLANS AND SPECIFICATIONS.

IV. PRELIMINARY SOIL MIX DESIGN INDICATING TYPE OF BINDER MATERIAL AND VOLUMETRIC PROPORTIONS FOR INITIAL TRIALS ON-SITE TO BE ADJUSTED BASED ON FIELD OBSERVATIONS AND EARLY STRENGTH RESULTS (SEE PART 3.2 TEST SECTION).

B. ACCURATE DAILY RECORDS OF THE WORK TO BE SUBMITTED BY CLOSE OF BUSINESS THE FOLLOWING DAY, INCLUDING:

I. COLUMN ID

II. DIAMETER

III. WORKING PAD ELEVATION

IV. MIXING DEPTH

V. START TIME

VI. TIME AT TIP ELEVATION

VII. FINISH TIME

VIII. MIXING DURATION

IX. GROUT MIX DETAILS (PERCENT WATER AND REAGENT BINDER)

X. GROUT INJECTION WITH DEPTH

XI. TOTAL INJECTED GROUT

XII. BLADE ROTATION NUMBER (BRN) WITH DEPTH

D. ANY PROPOSED CHANGE IN THE WORK PROCEDURES PLAN MADE NECESSARY BY CONDITIONS ENCOUNTERED DURING CONSTRUCTION FOR REVIEW AND APPROVAL BY THE ENGINEER.

E. MATERIAL CERTIFICATIONS FOR CEMENT BINDER TO BE USED IN THE PROJECT.

F. WEIGHTS: CERTIFICATES OF BATCH WEIGHTS FOR EACH TRUCK LOAD DELIVERED IF ON-SITE BATCH PLANT IS NOT USED.

G. ADMIXTURES/POZZOLANS/ADDITIVES SUBJECT TO THE APPROVAL OF THE ENGINEER, IF USED.

H. QC TEST RESULTS: SUBMIT ALL QC TEST RESULTS WITHIN 48 HOURS OF TESTING.

I. REPORT SUMMARIZING TEST SECTION RESULTS AND CALIBRATION OF DRILLING EFFORT CRITERIA FOR COLUMN DEPTH TERMINATION APPROVED BY THE ENGINEER.

J. AS-BUILT REPORT DOCUMENTING THE CONSTRUCTED LOCATIONS AND DIMENSIONS OF ALL DSM COLUMNS, COMPILATION OF ALL QUALITY CONTROL AND QUALITY ASSURANCE DATA COLLECTED FOR THE PROJECT, AND EXPLANATION OF ANY DEVIATION FROM THE PLANS AND SPECIFICATIONS PREVIOUSLY REVIEWED APPROVED TO THE SATISFACTION OF THE ENGINEER.

K. THE CONTRACTOR WILL SUBMIT A WORK PLAN DETAILING THE CONSTRUCTION AND QA/QC OF THE LTP, MEETING THE DESIGN REQUIREMENTS HEREIN AND IN THE GEOTECHNICAL REPORT.

1.5 ACCEPTANCE

A. ACCEPTANCE OF THE DSM WORK WILL BE BASED ON COMPLIANCE WITH THE STRENGTH AND GEOMETRY REQUIREMENTS OF THE PLANS AND SPECIFICATIONS AS VERIFIED BY THE ENGINEER'S QA TESTING. THE MATERIAL FORMED BY MIXING THE GROUT WITH THE IN SITU SOIL SHALL MEET A MINIMUM REQUIRED UNCONFINED COMPRESSIVE STRENGTH OF 150 POUNDS PER SQUARE INCH (PSI) AT 28 DAYS. TESTS WILL BE CONSIDERED PASSING IF THEY ARE AT LEAST 90% OF THE 150 PSI STRENGTH REQUIREMENT PROVIDED THAT NO MORE THAN 10% OF ALL TESTS FALL BELOW THE REQUIREMENT AND THE OVERALL AVERAGE STRENGTH EXCEEDS THE REQUIREMENT. IF THE UNCONFINED COMPRESSIVE STRENGTH RESULTS DO NOT MEET THAT CRITERIA, THE DSM SUBCONTRACTOR SHALL SUBMIT A MITIGATION PLAN FOR REVIEW AND APPROVAL BY THE ENGINEER.

PART 2 – PRODUCTS

2.1 MATERIALS

A. FRESH OR RECLAIMED WATER, FREE OF ANY DELETERIOUS SUBSTANCE THAT COULD ADVERSELY AFFECT THE GROUT PROPERTIES SHALL BE USED.

B. BINDER AGENT USED FOR THE PROJECT SHALL CONSIST OF PORTLAND CEMENT TYPE II/V CONFORMING TO ASTM DESIGNATION C150. THE CEMENT SHALL BE ADEQUATELY PROTECTED FROM MOISTURE AND CONTAMINATION WHILE IN TRANSIT AND STORAGE AT THE JOB SITE. RECLAIMED CEMENT OR CEMENT CONTAINING LUMPS OR DELETERIOUS MATTER SHALL NOT BE USED.

C. THE WATER AND CEMENT SHALL BE PREMIXED TO FORM A GROUT FOR INJECTION AND MIXING WITH THE IN-SITU SOIL. MATERIALS SHALL BE COMBINED IN PREDETERMINED WEIGHED PROPORTIONS WITH ITS QUALITY EVALUATED BY SPECIFIC GRAVITY MONITORED AT LEAST ONCE PER INSTALLATION BY MUD BALANCE.

D. THE DESIGN UNCONFINED COMPRESSIVE STRENGTH OF THE SOIL-CEMENT MATERIAL COMPRISING THE DSM COLUMNS IS 150 PSI AT 28 DAYS.

PART 3 – EXECUTION

3.1 EQUIPMENT

A. A PURPOSE BUILT HOLLOW STEM AND MIXING PADDLE TOOL ATTACHED TO A HIGH TORQUE ROTARY DRILL ON TRACKS SHALL BE USED TO ACCOMPLISH THE DSM. MIXING TOOLS OF 4- AND 6-FOOT-DIAMETER WILL BE IMPLEMENTED FOR THIS PROJECT. MIXING TOOLS SHALL CONSIST OF A MINIMUM OF FOUR (4) MIXING BLADES (4 PAIRS OF MIXING PADDLES).

B. CEMENT WILL BE STORED IN PURPOSE BUILT SILOS.

C. WATER SHALL BE MIXED WITH CEMENT IN A PURPOSE-BUILT WEIGH-BATCH MIXER TO PRODUCE SLURRY WITH A CONSISTENT SPECIFIC GRAVITY OR WATER:CEMENT RATIO FOR PROPER MIXING. JET VALVE MIXING OR OTHER CONTINUOUS MIXING METHODS WILL NOT BE ALLOWED.

D. GROUT SHALL BE DELIVERED TO THE MIXING RIG BY APPROPRIATELY SIZED POSITIVE DISPLACEMENT PUMPS. PROGRESSIVE CAVITY PUMPS SHALL NOT BE ALLOWED.

3.2 TEST SECTION

A. LOCATIONS: PRIOR TO INITIATING PRODUCTION WORK, DSM SUBCONTRACTOR SHALL INSTALL A MINIMUM OF TWO DSM COLUMNS WITH VARYING MIX DESIGN DOSAGE AT EACH OF THE SIX TEST SECTION LOCATIONS INDICATED ON THE PLANS.

B. EVALUATION GOALS: THE PURPOSE OF THE TEST SECTION IS TO EVALUATE THE FOLLOWING ITEMS PRIOR TO INITIATING PRODUCTION WORK. THE DSM SUBCONTRACTOR MAY PROCEED IMMEDIATELY TO PRODUCTION WHILE TEST SECTION EVALUATION RESULTS ARE PENDING BUT DOES SO AT ITS OWN RISK.

I. COLUMN DEPTH: COLUMN INSTALLATION DEPTHS FOR THE PROJECT ARE CONTROLLED BY THE DEPTH TO THE CAPISTRANO FORMATION CONTACT AS DESCRIBED IN SECTION 3.3.G. DURING TEST SECTION INSTALLATION ADJACENT TO EXISTING EXPLORATION DATA, DSM SUBCONTRACTOR SHALL MONITOR AND RECORD INDICATORS OF DRILLING EFFORT (E.G. ROTARY TORQUE APPLIED AND CROWD PRESSURE). DSM SUBCONTRACTOR SHALL PROPOSE A READILY IDENTIFIABLE METRIC SUBJECT TO THE ENGINEER'S APPROVAL FOR THE DRILL OPERATOR TO OBSERVE DURING INSTALLATION AS EVIDENCE OF ENCOUNTERING THE CAPISTRANO FORMATION.

II. MIX CONSISTENCY: DURING TEST SECTION MIXING THE DSM SUBCONTRACTOR AND ENGINEER SHALL OBSERVE

III. STRENGTH: A MINIMUM OF TWO WET-GRAB SAMPLES SHALL BE COLLECTED FROM EACH TEST SECTION COLUMN INSTALLED AT DEPTHS OF 1/3 AND 2/3 THE TOTAL INSTALLATION DEPTH. EACH SAMPLE COLLECTED SHALL BE CAST INTO CYLINDERS FOR UNCONFINED COMPRESSION STRENGTH TESTING AND EVALUATION AS DESCRIBED IN SECTION 3.4.B.

IV. LOAD TEST: DSM SUBCONTRACTOR SHALL CONDUCT A MINIMUM OF FOUR LOAD TESTS PER THE REQUIREMENTS OF THIS SPECIFICATION TO ASSESS THE 4-FOOT-DIAMETER DSM COLUMN GEOTECHNICAL CAPACITY ADJACENT TO EXPLORATORY TEST DATA. SEE PROPOSED LOAD TEST LOCATIONS ON SHEET GI-3.

3.3 CONSTRUCTION

A. INSTALL DSM COLUMNS AT THE LOCATIONS AND TO THE DEPTH INDICATED ON THE DSM PLAN.

B. HORIZONTAL ALIGNMENT: THE DSM COLUMNS SHALL BE CAREFULLY SURVEYED AND STAKED OUT PRIOR TO INSTALLATION. THE COLUMNS SHALL BE CONSTRUCTED WITHIN 4 INCHES OF THE LOCATIONS SHOWN ON THE DRAWINGS.

C. VERTICAL ALIGNMENT: VERTICAL ALIGNMENT OF THE AUGER STROKE WILL BE CONTROLLED BY THE EQUIPMENT OPERATOR. THE COLUMN VERTICALITY SHALL HAVE A TOLERANCE OF 1:50 MAXIMUM DEVIATION.

D. MIXING SHAFT SPEED: THE MIXING SHAFT SPEED (RPMS) SHALL BE ADJUSTED TO ACCOMMODATE AN ADEQUATE RATE OF MIXING SHAFT PENETRATION BASED ON THE DEGREE OF DRILLING DIFFICULTY. THE MIXING SHAFT SPEED CAN BE ADJUSTED ACCORDING TO DRILLING DIFFICULTY.

E. BOTTOM MIXING: THE BOTTOM OF THE COLUMNS SHALL BE DOUBLE MIXED BY RAISING THE MIXING SHAFTS FIVE FEET OFF THE BOTTOM AND THEN REINSERTING THEM FOR REMIXING.

F. GROUT TAKE: THE GROUT TAKE (OR INJECTION RATE) PER VERTICAL FOOT OF COLUMN WILL BE ADJUSTED TO THE REQUIREMENTS OF THE DESIGN MIX. APPROPRIATE DELIVERY PUMPS SHALL BE USED TO TRANSFER THE GROUT FROM THE MIX PLANT TO THE DSM RIG. A FLOW MONITORING DEVICE WILL BE INSTALLED IN THE GROUT LINE TO DETECT LINE BLOCKAGE AND ELECTRONICALLY RECORD INJECTION RATES AND VOLUMES VERSUS DEPTH AND TIME FOR QUALITY CONTROL MONITORING.

I. THE RATE OF APPLICATION MAY BE CONTROLLED AND MONITORED BY ADJUSTING THE PUMP OUTPUT TO THE PENETRATION RATE SO THAT A PRESET GROUT TAKE CAN BE ACHIEVED. TYPICALLY, THE APPLICATION RATE CAN BE SUCCESSFULLY CONTROLLED BY EXPERIENCED OPERATORS ONCE THE PATTERN OF OPERATION IS ESTABLISHED.

II. SOME VARIATIONS OF THE GROUT TAKE WILL OCCUR DUE TO FIELD CONDITIONS. HOWEVER, THE OVERALL APPLICATION RATE TO EACH STROKE CAN BE MONITORED, CALCULATED AND CONTROLLED. ADDITIONAL MIXING IS TO BE USED WHEN NECESSARY TO DISTRIBUTE THE GROUT THROUGH THE ENTIRE COLUMN. THE INJECTION OF GROUT TO EACH STROKE WILL BE MONITORED, CHECKED BY CALCULATION AND RECORDED.

G. COLUMN DEPTH:

I. BUTTRESS COLUMNS: COLUMNS INSTALLED FOR THE LATERAL SPREAD BUTTRESS SHALL BE INSTALLED TO A MINIMUM OF 4 FEET BEYOND THE CAPISTRANO FORMATION CONTACT AS IDENTIFIED BASED ON THE DRILLING EFFORT CALIBRATION PERFORMED DURING THE TEST SECTION WORK AND SUBJECT TO THE APPROVAL OF THE ENGINEER. PRACTICAL REFUSAL (AS DEFINED IN SECTION 3.3.H) ENCOUNTERED PRIOR TO ACHIEVING THE REQUIRED 4-FOOT EMBEDMENT INTO CAPISTRANO FORMATION MAY BE APPROVED BY THE ENGINEER ON A CASE-BY-CASE BASIS BUT THE DSM SUBCONTRACTOR SHALL BE PREPARED TO INITIATE PREDRILLING IF NEEDED TO ACHIEVE THE REQUIRED EMBEDMENT AT NO ADDITIONAL COST TO THE OWNER.

II. BUILDING SUPPORT COLUMNS: DSM COLUMNS INTENDED FOR SUPPORT OF THE RETAIL BUILDINGS SHALL BE INSTALLED TO A MINIMUM OF 1 FOOT BEYOND THE CAPISTRANO FORMATION CONTACT OR TO PRACTICAL REFUSAL. MEANS OF IDENTIFYING THE CAPISTRANO FORMATION CONTACT WILL BE BASED ON THE DRILLING EFFORT CALIBRATION PERFORMED DURING THE TEST SECTION WORK AND SUBJECT TO THE APPROVAL OF THE ENGINEER.

H. OBSTRUCTION/MIXING SHAFT PRACTICAL REFUSAL: IF OBSTRUCTIONS ARE ENCOUNTERED WHICH REDUCE THE RATE OF PENETRATION TO ONE FOOT PER MINUTE FOR TWO MINUTES UNDER FULL POWER, THE STROKE SHALL BE COMPLETED IN ACCORDANCE WITH THE SPECIFICATIONS AND REMEDIAL MEASURES WILL BE TAKEN. SUBCONTRACTOR SHALL NOTIFY CONTRACTOR TO INVESTIGATE, CONFIRM, AND REMOVE SAID OBSTRUCTIONS FROM THE SOIL MIXING AREA. ONCE CONTRACTOR REMOVES OBSTRUCTIONS AND BACKFILLS AND COMPACTS (IN LIFTS NOT TO EXCEED 3 FEET IN UNCOMPACTED THICKNESS) THE REMOVAL AREA WITH GRANULAR SAND OR SANDY GRAVEL MATERIAL, THE DSM SUBCONTRACTOR SHALL RETURN TO MIXING THE BACKFILLED AREAS AND REMAINING DSM COLUMNS PER PLANS AND SPECS. IF REMOVAL OF OBSTRUCTIONS BY CONTRACTOR DAMAGES A PREVIOUSLY INSTALLED DSM COLUMN, ASSOCIATED RE-INSTALLATION WORK SHALL BE COMPENSATED BY AS EXTRA AT THE CONTRACT UNIT PRICES. IF IT IS INFEASIBLE OR IMPRACTICAL TO CLEAR AN OBSTRUCTION FROM A DESIGN INSTALLATION LOCATION, CONTRACTOR MAY PROPOSE A MODIFICATION TO THE DESIGN PROVIDED THE ORIGINAL PERFORMANCE IS MAINTAINED SUBJECT TO THE REVIEW AND APPROVAL OF THE ENGINEER.

I. MIXING ENERGY: THE DSM SUBCONTRACTOR SHALL MIX EACH COLUMN WITH SUFFICIENT MIXING ENERGY THROUGHOUT TO PROPERLY PROCESS THE SOIL CEMENT PRODUCT. THE MIXING ENERGY SHALL BE DEMONSTRATED BY MEASURED AND RECORDED BRN REPORTED FOR EACH INSTALLATION AND THE MIXING ENERGY APPLIED SHALL MINIMALLY ACHIEVE THAT REQUIRED TO PRODUCE SATISFACTORY RESULTS DURING THE TEST SECTION.

J. NO EXCAVATION OR HEAVY GRADING BY CONTRACTOR SHALL PROCEED PRIOR TO 3 DAYS AFTER DSM COLUMN CONSTRUCTION UNLESS APPROVED BY THE DSM DESIGN ENGINEER.

K. UTILITY TRENCH: EXCAVATE THE COMPLETED DSM COLUMNS AS NECESSARY FOR UNDERGROUND UTILITIES. TRENCH BACKFILL WILL BE AS FOLLOW:

I. FOR TRENCHES CUT INTO BUTTRESS DSM AND ABOVE GWT: BACKFILL WILL NATIVE SOILS OR AS APPROVED BY THE ENGINEER.

II. FOR TRENCHES CUT INTO BUTTRESS DSM AND EXTEND BELOW GWT: BACKFILL WITH CEMENT SLURRY WITH COMPRESSIVE STRENGTH OF AT LEAST 300 PSI.

III. UTILITIES TRENCHES WILL AVOID CUTTING INTO THE DISCRETE 4' DIAMETER DSM COLUMNS SUPPORTING BUILDINGS AND SLABS.

L. MANAGEMENT OF SPOIL TO BE COORDINATED BETWEEN CONTRACTOR AND DSM SUBCONTRACTOR.

3.4 QUALITY CONTROL AND QUALITY ASSURANCE

A. PRIOR TO CONSTRUCTION, A PRELIMINARY MIX DESIGN SHALL BE GENERATED BY THE SUBCONTRACTOR. THE MIX DESIGN MAY BE OBTAINED BASED ON SITE SOILS AND LABORATORY TESTING, OR ALTERNATIVELY, BASED ON THE SUBCONTRACTORS DATABASE IN SIMILAR SOIL CONDITIONS AND STRENGTH REQUIREMENTS.

B. WET SAMPLING: THE DSM SUBCONTRACTOR SHALL OBTAIN WET BULK SAMPLES OF THE SOIL CEMENT MIX AND CAST IT IN CYLINDERS FOR SUBSEQUENT QUALITY CONTROL TESTING BY THE DSM SUBCONTRACTOR, AND QUALITY ASSURANCE TESTING AND ACCEPTANCE BY THE ENGINEER.

I. ONE SAMPLE WILL BE RETRIEVED PER WORK DAY PER RIG.

II. THE VOLUME OF SAMPLE RECOVERED DURING EACH SAMPLING SHALL BE SUFFICIENT TO CAST 6 SAMPLE CYLINDERS EACH MEASURING 3" DIAMETER BY 6" HIGH. A ½" SIEVE WILL BE USED TO SCREEN THE MATERIAL IN ORDER TO FACILITATE APPROPRIATE SCALING OF INCLUSIONS AND PROPER MODELING OF THE 3 INCH CYLINDERS.

III. OF THE 6 CYLINDERS CAST, 3 WILL BE PROVIDED TO THE ENGINEER FOR QUALITY ASSURANCE TESTING AND 3 WILL BE RETAINED BY THE DSM SUBCONTRACTOR FOR QUALITY CONTROL TESTING.

IV. TO AVOID DISTURBANCE, THE CYLINDERS ARE TO BE CURED ON SITE IN A COOLER WITH A SMALL AMOUNT OF WATER TO MAINTAIN A STABLE, COOL AND MOIST CURING ENVIRONMENT FOR 2 DAYS.

V. AFTER QUALITY ASSURANCE SAMPLES ARE RETRIEVED BY THE ENGINEER, ALL WET GRAB SAMPLES SHALL BE STORED IN A MOIST ROOM (NOT SUBMERGED) IN ACCORDANCE WITH ASTM C 192 UNTIL THE TEST DATE.

VI. THE QUALITY CONTROL SAMPLES WILL BE TESTED (BY THE DSM SUBCONTRACTOR) FOR UCS IN ACCORDANCE WITH ASTM D1633, AT 3-DAY, 7-DAY, AND 14-DAY AFTER CASTING. THE RESULTS WILL BE USED TO EXTRAPOLATE THE EXPECTED STRENGTH AT 28-DAYS.

VII. THE QUALITY ASSURANCE SAMPLES WILL BE TESTED (BY THE ENGINEER) FOR UCS IN ACCORDANCE WITH ASTM D1633, AT 7-DAY, 14-DAY, AND 28-DAY AFTER CASTING.

VII. WHEN TIME OR SCHEDULE DOES NOT PERMIT A 28-DAY CURING STRENGTH EVALUATION, THE FOLLOWING UCS AGING CORRELATION WILL BE TENTATIVELY APPLIED TO THIS JOB:

28 : 7 DAY, 1.57

VIII. THE ABOVE CORRELATION MAY BE ADJUSTED FOR SITE-SPECIFIC FINDINGS AS THE PROJECT DEVELOPS.

IX. THE DESIGN STRENGTH FOR THIS PROJECT AT 28-DAYS IS 150 PSI. SUBJECT TO THE APPROVAL OF THE ENGINEER, 7-DAY TEST RESULTS MAY BE ACCEPTED BASED ON THE CORRELATION ABOVE OR A REVISED CURING FACTOR BASED ON PROJECT-SPECIFIC STATISTICAL ANALYSIS OF AVAILABLE DATA.

C. LOAD TEST:

I. DSM SUBCONTRACTOR SHALL PERFORM A MINIMUM OF FOUR COMPRESSION LOAD TEST ON 4-FOOT-DIAMETER COLUMNS AT THE TEST SECTION LOCATION SPECIFIED FOR THE BUILDINGS ON THE DRAWINGS.

II. COMPRESSION LOAD TEST SHALL BE IN GENERAL ACCORDANCE WITH ASTM D1143. THE TEST COLUMN SHALL BE CONDUCTED TO AT LEAST 150% OF THE STATIC DESIGN LOAD.

III. LOAD TEST WILL NOT BE PERFORMED BEFORE THE COLUMN HAS ACHIEVED SUFFICIENT UNCONFINED COMPRESSIVE STRENGTH AS DEMONSTRATED BY LABORATORY TESTING ON WET GRAB SAMPLES.

D. OBSERVATION: A REPRESENTATIVE OF THE ENGINEER SHALL BE PRESENT FULL-TIME DURING ALL INSTALLATION WORK TO OBSERVE THE CONSTRUCTION OF THE DSM COLUMNS, SAMPLING, AND TESTING TO VERIFY THE DSM SUBCONTRACTOR PERFORMS THE WORK IN SUBSTANTIAL CONFORMANCE WITH THESE SPECIFICATIONS. THE ENGINEER SHALL MAINTAIN PARALLEL HAND RECORDS OF PERTINENT INSTALLATION DATA FOR COMPARISON WITH REPORTED INSTALLATION LOGS AND OBTAIN TEST SPECIMENS OF THE WET-SAMPLES COLLECTED FOR QUALITY ASSURANCE TESTING.

E. UPON COMPLETION OF SITE GRADING AND DSM/LTP INSTALLATION, WRITTEN CONFIRMATION FROM THE PROJECT GEOTECHNICAL CONSULTANT OF RECORD WILL BE PROVIDED TO CONFIRM PRELIMINARY RECOMMENDATIONS FOR PROPOSED STRUCTURE(S) ALLOWABLE BEARING VALUE REMAINS VALID. ADDITIONAL RECOMMENDATIONS SHALL BE PROVIDED AS NECESSARY.

Hadi Tabatabaee
BUILDING OFFICIAL

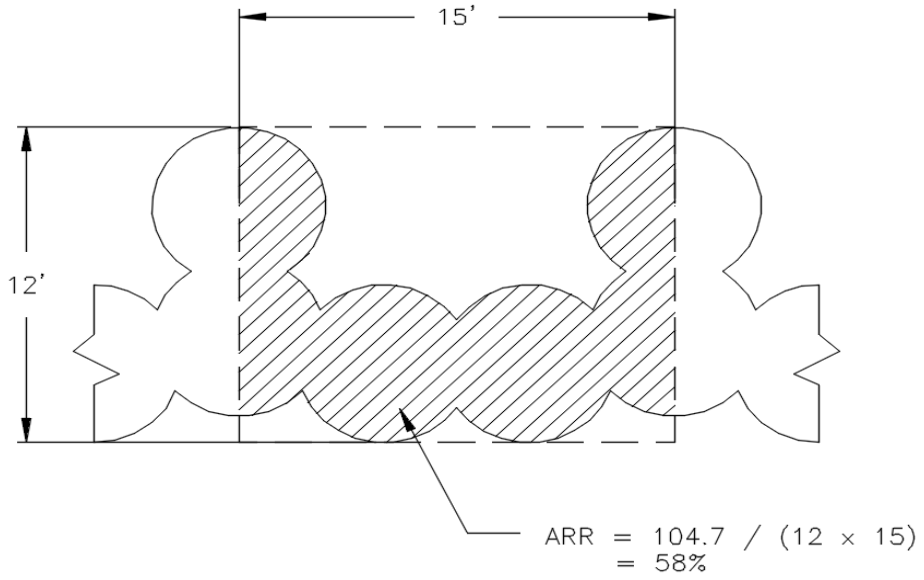
Determine composite shear strength of DSM buttress for use in pseudostatic slope stability anlysis
Lateral stread buttress

Geometry:



Input values:

ARR =	**58%**		Area replacement ratio
q_DSM28 =	**150**	psi	Design compressive strength of DSM at 28 days
fc =	**2**		Curing factor (long term)

Calculations:

q_DSM =	300	psi	Long term compressive strength of DSM for seismic condition
s_DSM =	150	psi	Shear strength of DSM = 1/2 compressive strength
=	21600	psf	
s_comp =	12528	psf	Composite shear strenght = s_DSM x ARR (Neglect shear strength of native soils)

Select conservative value of **7200 psf** to ensure strain compatibility

Seismic Displacement Calculation

Reference: NCHRP 611

Inputs

PGA modified for site class	k_max	**0.67**	g
Earthquake magnitude	M	**6.9**	
Spectral acceleration at 1 sec	S1	**0.45**	g

Calculated

$$\ln(\mathrm{PGV}) = 3.97 + 0.94\ln(S_1) + 0.013\left(\ln(S_1) + 2.93\right)^2 + 0.063M \qquad (5\text{-}9)$$

Peak ground velocity	PGV	41.0	cm/s
		16.1	in/s

WUS-Soil:

$$\log(d) = -1.56 - 0.72\log\left(k_y/k_{\max}\right) + 3.21\log\left(1 - k_y/k_{\max}\right) - 0.87\log(k_{\max}) + 1.62\log(\mathrm{PGV}) \qquad (5\text{-}5)$$

Yield acceration from pseudo static analysis	k_y	**0.78**	g
Correlated displacement in soils - West US region	d	**0.0**	inches

Downdrag Calculations per AASHTO LRFD Bridge Design (2012) - Drilled Shafts

Notes:

1. Please enter the required inputs shown in blue.
2. This spreadsheet should be used for drilled shafts, only.
3. The formulations are based on povisions of AASHTO LRFD Bridge Design, 2012 - Section 10.8.
4. Per section 10.8.3.5.2, Beta method is used for cohesionless material , where N60 is average SPT blow count corrected only for hammer efficiency.
5. Put zero values for Su and N60 if not applicable.
6. Units are all Imperial. The macro must be modified for metric units.
7. Do not add any row or column to this spreadsheet.
8. The spreadsheet is formulated up to row No. 6000.

Input Parameters

Pile Diameter =	4	ft	
Wall thickness	24.0	inch	Use D/2 for concrete piles
Elastic Young's Modulus =	12960.0	ksf	
Depth where FF settlement is 0.4" =	19.0	ft	
Column Depth =	20.0	ft	
Ground Water Table Depth =	10.0	ft	

Click below to run analysis

Calculate Downdrag Force & the Resulting Pile Elastic Compression

Outputs

Negative Friction (Downdrag) =	128.7	kips
Pile Elastic Compression=	0.02	inch
Ultimate Positive Friction =	12.6	kips
Ultimate End Bearing =	706.5	kips

Input Parameters							Calculation Results						
Depth (ft)	Liquefiable?	(Su_liq)/sigma'	Cohesive Material- Su (psf)	Cohesionless Material - N60 (blows/ft)	Is the soil gravelly sand or gravel?	Unit Weight (pcf)	Sigma_v' (psf)	alpha	Beta	Average Mob. Friction (psf)	Average Mob. Friction (psf)	Negative Friction, i.e., downdrag (kips)	Positive Friction (kips)	Cumulative Comp. due to downdrag load (inch)

PLAXIS Analysis of LTP Section

Building&Safety: Ryan Rose 12/11/2023
Approval: Geotechnical Reports
Permits: GRD21-0090

County of Orange - OC Public Works
OC Development Services
APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works, OC Development Services Department. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County ordinance or law.
Hadi Tabatabaee
BUILDING OFFICIAL

Static and seismic performance of the proposed LTP system under slab load of 300 psf was evaluated using the finite element computer program PLAXIS, 2D. The geometry of the FE modal was composed of two-dimensional (2D) plane-strain model of:

a. 4ft diameter DSM columns at 12ftx12ft spacing and 20ft deep;
b. Three (3) layers of 12" thick cement-treated fill with UCS=200psi;
c. Soil layers from the ground information collected from CPTs and borings.

The effective width of the DSM columns were taken as 1.05 ft in order to account for the three-dimensional effects in the 2D plain-strain model. Equivalent secant elastic parameters and shear strength of the native soils were obtained from the site investigation data. Table A below presents the input soil parameters.

Table A. Input Soil Properties for PLAXIS analysis.

Depth (ft)	Soil Type	Static Condition		Liquefied Condition	
		Secant Young's Modulus (ksf)	Shear Strength	Secant Young's Modulus (ksf)	Shear Strength
0 to 9	Af/Qm	400	Phi = 31, c = 395 psf	-	-
9 to 20	Af/Qm (below GWT)	400	Phi = 30, c = 80 psf	100	Phi = 5.7 deg
Below 20	Tc	3000	Phi = 34, c = 695 psf	-	-
-	LTP (UCS, 28day=200 psi)	7200	14400 psf	14400 (365 day UCS)	28800 psf (365 day UCS)
-	CDSM (UCS, 28day=150 psi)	6480	10800 psf	12960 (365 day UCS)	21600 psf (365 day UCS)

The main goal of the analysis was to ensure that the deformations are in a tolerable ranges and LTP system did not show any signs of failure in tension and compression under the slab load during static and seismic loadings. Geometry of the model, deformations and stresses are presented in the following pages.

GMU Project 17-206-02

Subject: Geotechnical Review of AGI Deep Soil Mixing (DSM) Submittal, Dana Point Harbor Revitalization – Commercial Component, City of Dana Point, County of Orange, California

References:
(1) Deep Soil Mixing Design Submittal, Dana Point Harbor Commercial Core, City of Dana Point, County of Orange, California, prepared by Advanced GeoSolutions, Inc. (AGI), dated May 27, 2021 (AGI Reference: L19-1748).

(2) Our "Geotechnical Investigation Report, Volumes 1, 2, and 3, Dana Point Harbor Revitalization: Buildings 1 through 12 – Commercial Component, City of Dana Point, California," dated May 27, 2021 (GMU Project 17-206-02).

Dear Mr. Ward:

The purpose of this correspondence is to confirm in writing that GMU Geotechnical, Inc. (GMU) has performed a geotechnical review of the reference (1) Deep Soil Mixing (DSM) design submittal by Advanced GeoSolutions, Inc. (AGI) for the subject project. The AGI submittal is to support the foundation design of the proposed buttress and eight (8) new retail/office/surf museum/restaurant buildings (Buildings 1, and 6-12) for the commercial core. The subject site is bounded by Dana Point Harbor Drive, the planned realignment of Golden Lantern, and the new proposed parking structure and existing parking lot on the north, the existing boat launch ramp and Embarcadero Marina area on the east, the existing Casitas Place and the existing Marina Inn for the future Hotel component site on the west, and the existing sea wall and harbor on the south.

As is standard of practice, Quality Control (QC) for the Deep Soil Mix (DSM) installations will performed by both the DSM contractor and the Geotechnical Engineer of Record (GMU). The QC requirements to be completed by the contractor are contained on Sheet GI-2 contained in the attached reference (1) AGI plans under "General Notes and Details". Note VII under 3.4 Quality Control and Quality Assurance also refers to supplemental testing by the "engineer". This supplemental DSM QC testing will be performed full-time by one of GMU's Senior Engineering Technicians reporting directly to the Geotechnical Engineer-of-Record (GE) and includes:

- Observation, documentation, and verification of geotechnical conditions.
- Determination/verification that bedrock has been reached in the buttress and under each building to design penetration depth prescribed at each DSM location.
- Depth and diameter of each DSM.
- Verification and sampling of DSM installation per design.
- Observation and documentation of load testing.

It should be further noted that all the above QC test results will be submitted to the GE of record at GMU for his review and acceptance from a geotechnical engineering perspective.

Based on our review, the attached reference (1) AGI Deep Soil Mixing design submittal has been prepared in general accordance with the parameters and recommendations presented in our reference (2) report. All the recommendations included herein, and in our reference (2) report, remain applicable to the site improvements; thus, the subject design submittal is acceptable from a geotechnical perspective.

Should you have any questions, please do not hesitate to contact us.

Respectfully submitted,

David R. Atkinson

1.0 INTRODUCTION

Advanced Geosolutions, Inc. (AGI) is pleased to present this design submittal package for deep soil mixing (DSM) at the planned redevelopment area located at the harbor in Dana Point, California. We understand the redevelopment involves the construction of new hotels, new commercial buildings and new marine facilities. The submittal herein addresses the design for the commercial area of this redevelopment.

The geotechnical report by GMU identifies medium dense to dense sandy artificial fill at the site down to a depth of approximately 20 feet below grade at the time of geotechnical exploration. They recommended ground improvement to mitigate excessive seismically induced lateral spreading at the project site. Ground improvement is also intended to mitigate uncertainty about the competence of the undocumented artificial fill soils and the potential associated risk with constructing structures overlying those materials. DSM was selected by the design team as the most appropriate ground improvement technique for this project based on the soil conditions, performance goals, efficiency, and site constraints.

Our design meets the performance criteria as described in the following sections. Concepts, calculations, means, and methods in this design are deemed intellectual property of AGI, and shall remain confidential. AGI's design, and any other related information, shall not be made available to another party other than the members of the design team without the express written consent of AGI. We anticipate that a set of construction drawings and specifications will be put out to bid but only the minimal set of documents required to bid the installation work should be distributed to bidders as approved by AGI.

2.0 REFERENCE DOCUMENTS AND INFORMATION

In preparing this design AGI relied on information provided by the design team, including:

- Geotechnical Investigation Report, Volumes 1, 2, and 3, Dana Point Harbor Revitalization: Buildings 1 through 12 – Commercial Component, City of Dana Point, California. Report no. 17-206-02 prepared by GMU and dated 5/27/2021.
- Site plan CAD file provided by GMU
- Foundation plan for building 1 prepared by KPFF dated 10/8/2020
- Foundation plans for buildings 6-9 prepared by KPFF dated 4/9/2021
- Foundation plans for building 10-12 prepared by KPFF dated 4/12/2021

3.0 DESIGN CRITERIA

Per the Geotech report's recommendation and discussion with the design team, the ground improvement shall be designed in consideration of the following performance criteria:

- Design earthquake Magnitude (Mw) = 6.9 and PGA = 0.67g

Building&Safety: Ryan Rose 12/11/2023
Approval: Geotechnical Reports
Permits: GRD21-0090

Hadi Tabatabaee
BUILDING OFFICIAL

- Reduce lateral spread movement to 3 inches or less behind the DSM buttress
- Ground improvement will directly support all footings with at least 5,000 psf allowable bearing pressure.
- Limit total static settlement to 1 inch or less.
- Reduce total seismic settlement to 0.5 inch or less.
- Building slab-on-grade areas require improvement or support to mitigate potential poor performance of undocumented fill materials.

4.0 CEMENT DEEP SOIL MIXING (DSM) DESIGN

The proposed DSM layout is presented in Appendix A. The DSM program includes two components: (1) DSM buttress along the waterfront, between the existing seawall and the proposed building, and (2) discrete DSM columns under the proposed buildings to support structural loads with a soil-cement load transfer platform (LTP) to distribute slab loading to the DSM columns.

The buttress is 12 feet wide and consists of overlapping 6-ft diameter DSM with a continuous front row. The columns will embed 4 feet into the Capistrano formation.

The DSM system supporting Buildings 6 through 12 consists of 4-ft diameter columns centered under all footings. In addition, the same 4-ft diameter columns are installed in a 12-ft grid pattern throughout slab-on-grade areas in building interiors. The 4-ft diameter DSM columns for building support will extend to practical refusal to rest on competent bedrock materials.

The DSM design unconfined compressive strength (UCS) is 150 psi at 28 days.

4.1 Lateral Spread

AGI performed a pseudostatic slope stability analysis in order to determine the post-improvement critical horizontal seismic coefficient (also called yield acceleration, k_y), which is a necessary input value to estimate lateral slope deformation. The analysis is presented in Appendix B1. The slope geometry and soils parameters used in the model were provided by GMU.

For section A, the composite shear strength of the DSM buttress was calculated based on the area replacement ratio (ARR), and this calculation is shown in Appendix B2. For sections C and D, the DSM block is modeled as a 5-ft wide (effective width) zone with 100% ARR on the perimeter of Building 1, while the soils inside the block is assigned unimproved strength without liquefaction.

AGI estimated lateral spread deformation using the empirical equations outlined in NCHRP Report 611 (2008), and the calculation is shown in Appendix B3. The results are summarized in Table 1 below.

APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works/ OC Development Services of Orange County. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

Table 1. Estimated Post-improvement Slope Deformation

Section	Ky from pseudostatic analysis	Estimated Slope deformation (inch)
Section A	0.26g	1.4
Section C	0.78g	0.0
Section D	0.49g	0.1

AGI performed all applicable internal stability checks of the buttress in accordance with FHWA guidelines. Those checks included bearing capacity, overturning, crushing at the toe, racking, and internal shear failures. The analysis is included in appendix B4.

4.2 Building Support

The structural capacity and geotechnical capacity calculation are included in Appendix C1 and C2, respectively. The analysis results indicate that the allowable load on a 4-ft diameter DSM column bearing on bedrock is 200 kips.

Building loading information was not provided with the structural drawings but we understand the footings were sized for 5,000 psf. Therefore the required number of DSM column supporting each footing was determined by taking the footing area, multiply by 5.0 ksf, and divide by 200 kips.

4.3 Static Settlement

Since the DSM columns will bear directly on formation material, the main source of static settlement is the elastic compression of the soil cement. This was calculated using the software RSPile by Rocscience. The calculation is shown in Appendix C3. The elastic modulus of DSM material was selected based on FHWA's recommended correlation (300 times design compressive strength).

The result indicates static settlement of the DSM column under design load is approximately 0.5 inch.

4.4 Seismic Settlement

The DSM columns transfer building loads to bedrock, but it does not densify the surrounding soils. When the soils liquefy after an earthquake, it would induce downdrag forces on the DSM columns which causes additional compression and settlement.

AGI estimated the magnitude of liquefaction-induced downdrag and column compression using method for piles, as outlined in the AASHTO Bridge Design Manual. This calculation is shown in Appendix D, which shows that downdrag force is approximately 128 kips for a 4-ft diameter

Hadi Tabatabaee
BUILDING OFFICIAL

column. And the corresponding seismic settlement due to DSM column compression is less than 0.1 inch.

The structural capacity and geotechnical capacity checks of Appendices C1 and C2 also ensure that the DSM column can resist this downdrag load in addition to the building design load.

5.0 DSM INSTALLATION METHOD

Cement Deep Soil Mixing is performed using a specialty, purpose-built drilling tool consisting of a series of mixing blades and/or paddles extending radially from a hollow stem. In general, as the mixing tool is advanced into the soil, the hollow stem is used as a conduit to pump grout slurry (a mixture of cement and water) and injected at the tip of the tool while blending the soils. Pre-augering or trenching operations may be used to facilitate mechanical breakdown and blending of firm or stiff soils, or to remove the upper strata before DSM operations, or to assist with spoil control. The resulting DSM product is an improved soil-cement column with low compressibility, high stiffness, and significant load carrying capacity. Typical DSM equipment and mixing tools are shown below in Figure 1.

Grout will be batched on site using an in-line jet valve or weight control system. We anticipate that cement and water will be the only components for the grout slurry. Water and/or cement component quantities are adjusted to achieve the target specific gravity prior to pumping it to the mixing drill rig. The batch plant and pump are expected to be located in an area to avoid relocating the facility during the entire DSM operation.

Figure 1. DSM mixing tool assembly (left) and track-mounted drilling rig constructing a DSM column (right)

6.0 LOAD TRANSFER PLATFORM (LTP)

As described above the design includes a LTP consisting of cement-treated soils at the ground surface. The LTP will be constructed in three 12-inch-thick lifts for a three-foot-thick section of

Hadi Tabatabaee
BUILDING OFFICIAL

soil cement to a design strength of 200 psi at 28 days. LTP will be constructed after completion of the DSM scope placing the lifts over the top of the DSM columns throughout the structural footprints of the buildings. The LTP is designed to transfer load from the floor slab to the regularly spaced DSM columns at 12 feet on-center. See Geotechnical Report for other requirements.

We have assumed slab loading (Dead plus live) of 300 psf for this design. The performance of the LTP under load was analyzed using 2D plane strain finite element in PLAXIS, which is presented in Appendix E. The analysis demonstrates that the specified LTP will provide satisfactory performance under 300 psf floor load. The design also conservatively assumes that the artificial soils underlying the LTP may settle and accounts for the potential that a gap may form below the bottom of the LTP and the underlying soil such that no support is provided other than by the DSM columns.

7.0 DEEP SOIL MIXING QUALITY ASSURANCE / QUALITY CONTROL (QA/QC)

Quality Control / Quality Assurance will be performed in accordance with the DSM specifications as outlined on the approved drawings.

8.0 LOAD TRANSFER PLATFORM QUALITY CONTROL

LTP Quality Control will be performed in accordance with the Geotechnical Report's recommendations.

9.0 CONCLUDING REMARKS

This ground improvement preliminary design is submitted to address the geotechnical concerns of the proposed buildings. The design uses DSM ground improvement technique to meet the project requirements provided to AGI.

The layout of our ground improvement program is presented in AGI's shop drawing (Appendix A). Relevant strength parameters of the design will be verified by the UCS results.

This design was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the geotechnical engineering profession currently practicing under similar conditions and in the same locality. No warranty is made nor implied.

We appreciate the opportunity to provide our services for this project. Please contact the undersigned with any questions regarding this document.

Building&Safety- Ryan Rose 12/11/2023
Approval: Geotechnical Reports
Permits: 20031-4994

County of Orange - OC Public Works
OC Development Services
APPROVED
This approval is based on the applicant's representation that the project will be constructed in accordance with the approved plans and specifications. Any deviations may require additional review and approval. It is the responsibility of the applicant to obtain all other required approvals prior to construction. Approval of this document does not authorize violation of any County Ordinance or State Law.
By: Ryan Rose
Building 1/1/24

PART 1 – GENERAL

1.1 SCOPE

A. DEEP SOILS MIXING (DSM) SHALL BE INSTALLED TO MITIGATE POTENTIAL FOR LATERAL SPREADING AND UNCERTAIN PERFORMANCE OF UNDOCUMENTED ARTIFICIAL FILL.

B. A LOAD TRANSFER PLATFORM (LTP) SHALL BE CONSTRUCTED THROUGHOUT ALL BUILDING FOOTPRINTS TO TRANSFER FLOOR SLAB LOADING TO UNDERLYING DSM COLUMNS AND PREVENT ADVERSE SETTLEMENT IN FLOOR SLAB AREAS THAT MAY RESULT FROM NEW LOADING APPLIED TO UNDERLYING UNDOCUMENTED ARTIFICIAL FILL.

C. THE DSM PLAN IS PREPARED IN ACCORDANCE WITH THE RECOMMENDATIONS OUTLINED IN THE GEOTECHNICAL REPORT PREPARED BY GMU DATED 5/27/2021.

D. THIS DESIGN IS BASED ON THE GEOTECHNICAL CHARACTERIZATION AND SOIL PARAMETERS PRESENTED IN THE REFERENCED GEOTECHNICAL REPORT, AS WELL AS LOAD REQUIREMENTS INDICATED ON THE STRUCTURAL DRAWINGS. THIS DESIGN WAS CONDUCTED IN A MANNER CONSISTENT WITH THE LEVEL OF CARE AND SKILL ORDINARILY EXERCISED BY MEMBERS OF THE GEOTECHNICAL ENGINEERING PROFESSION CURRENTLY PRACTICING UNDER SIMILAR CONDITIONS AND IN THE SAME LOCALITY. NO WARRANTY IS MADE NOR IMPLIED.

1.2 REFERENCES

A. GEOTECHNICAL INVESTIGATION REPORT, VOLUMES 1, 2, AND 3, DANA POINT HARBOR REVITALIZATION BUILDINGS 1 THROUGH 12, COMMERCIAL COMPONENT – REPORT NO. 17-206-02 PREPARED BY GMU DATED MAY 27, 2021.

B. ASTM C150 – SPECIFICATION FOR PORTLAND CEMENT

C. ASTM D1633 – STANDARD TEST METHODS FOR COMPRESSIVE STRENGTH OF MOLDED SOIL-CEMENT CYLINDERS

D. ASTM D4380 – DENSITY OF BENTONITE SLURRIES

F. FEDERAL HIGHWAY ADMINISTRATION DESIGN MANUAL: DEEP MIXING FOR EMBANKMENT, AND FOUNDATION SUPPORT, PUBLICATION NO. FHWA-HRT-13-046, OCTOBER 2013.

1.3 DEFINITIONS

A. DEEP SOIL MIXING (DSM) – A SOIL IMPROVEMENT TECHNIQUE USED TO CONSTRUCT IN SITU SOIL STRUCTURES OR TREAT SOILS IN PLACE, WITHOUT EXCAVATION OR DEWATERING. SOIL MIXING USES A LARGE, CRANE OR DRILL RIG – MOUNTED TURNTABLE TO INSERT A LARGE-DIAMETER (TYPICALLY 3- TO 8 -FOOT DIAMETER) TOOL INTO THE GROUND WHILE INJECTING AND MIXING A GROUT WITH THE SOIL. STABILIZED SOIL COLUMNS ARE CREATED THAT MAY BE JOINED TOGETHER BY OVERLAPPING TO FORM RETAINING WALLS OR FOUNDATION ELEMENTS, OR TO TREAT A LARGE BLOCK OF SOIL OR SLUDGE.

B. ASTM – ASTM INTERNATIONAL.

C. OWNER – THE OWNER AS REFERRED TO HEREIN IS DANA POINT HARBOR PARTNERS, LLC, C/O BURNHAM-WARD PROPERTIES.

D. ENGINEER – THE ENGINEER IS THE OWNER'S GEOTECHNICAL ENGINEER OF RECORD TO ACT ON ITS BEHALF IN THE EXECUTION OF THESE SPECIFICATIONS.

E. CONTRACTOR – REFERS TO THE GENERAL CONTRACTOR DIRECTLY CONTRACTED WITH THE OWNER AND SUBCONTRACTING THE DSM SCOPE TO THE DSM SUBCONTRACTOR.

F. DEEP SOIL MIXING SUBCONTRACTOR (DSM SUBCONTRACTOR) – AN INDIVIDUAL OR COMPANY WHO HAS HAD PROVEN AND SUCCESSFUL EXPERIENCE IN SOIL MIXING CONSTRUCTION.

G. GROUT – A STABLE COLLOIDAL SUSPENSION OF POWDERED CEMENT, BENTONITE, ADDITIVES AND/OR OTHER SIMILAR MATERIALS IN WATER. THE TERMS "GROUT" AND "SLURRY" ARE USED INTERCHANGEABLY IN THESE SPECIFICATIONS.

H. INJECTION RATIO – A VOLUMETRIC RATIO OF GROUT TO SOILS (E.G., 100 GALLONS/CUBIC YARD) TO BE MIXED IN A DSM COLUMN. THE GROUT INJECTION RATIO IS DETERMINED FOR EACH COLUMN BASED ON THE COLUMN DIMENSIONS, SOIL DENSITY, PATTERN OF TREATMENT, AND DESIRED APPLICATION RATE.

I. DSM COLUMN – ONE COMPLETED INSERTION, INJECTION AND MIXING OF THE SOIL WITH THE MIXING AUGER TO THE DESIGN DEPTH. THIS CREATES A COLUMN OF TREATED SOIL THE SAME DIAMETER AS THE MIXING AUGER. THE COLUMN MAY BE PRIMARY (THROUGH VIRGIN SOILS), SECONDARY (CONNECTING PRIMARY COLUMNS), TERTIARY, ETC.

J. WORKING PLATFORM – THE WORKING PLATFORM IS THE LEVELED AND STABLE SURFACE FROM WHICH THE DSM EQUIPMENT OPERATES.

K. MIXING AUGER/TOOL – THE SPECIAL TOOL THAT ATTACHES TO THE KELLY BAR AND IS INSERTED INTO THE GROUND TO MIX THE SOILS. THE TOOL MAY BE FITTED WITH PORTS FOR INJECTING GROUT, MIXING PADDLES, AUGER BLADES, ETC.

L. BLADE ROTATION NUMBER (BRN) – NUMBER OF BLADES X (RATE OF PENETRATION PLUS RATE OF WITHDRAWAL (IN REVOLUTIONS/METER). FOR EXAMPLE FOR 5 BLADES, RATE OF PENETRATION = 1 REVOLUTION/25 MM (40 REVOLUTIONS/M), AND RATE OF WITHDRAWAL = 1 REVOLUTION/20 MM (50 REVOLUTIONS/M), THE BRN = 5 X (40 + 50) = 450.

M. OBSTRUCTION – OBSTRUCTIONS ARE DEFINED AS MATERIALS CLASSIFIED AS UNDERGROUND UTILITIES, TREES (OR PARTS THEREOF), METAL, MAN-MADE OBJECTS, WOODEN/CONCRETE/STEEL OR ANY OTHER TYPE OF PILE OR DEEP FOUNDATION, OR NATURAL GROUND MATERIALS LARGER THAN A MAXIMUM COBBLE SIZE (8 INCHES MAXIMUM DIMENSION).

N. MIXING BLADE – A SINGLE MIXING BLADE SHALL CONSTITUTE A PAIR OF MIXING PADDLES ATTACHED TO THE SHAFT OF THE MIXING TOOL AT THE SAME ELEVATION. THE CUTTING PADDLES MAY ALSO BE CONSIDERED AS A MIXING BLADE.

O. DOSAGE – EXPRESSED AS THE MASS OF BINDER INTRODUCED PER VOLUME OF MIXED IN-SITU SOIL (E.G. KG/M^3).

1.4 SUBMITTALS

A. DSM WORK PLAN INCLUDING:

I. ASSIGNED NUMBER OF EACH COLUMN AS ID FOR INSTALLATION RECORD

II. NARRATIVE OF PLANNED MEANS AND METHODS TO EXECUTE THE INSTALLATION PER PLANS AND SPECIFICATIONS, INCLUDING SPECIFICATIONS OF THE GROUT BATCHING AND VERTICAL DRILL EQUIPMENT INTENDED FOR USE ON THE PROJECT.

III. NARRATIVE OF PLANNED MEANS AND METHODS TO EXECUTE THE QUALITY CONTROL REQUIREMENTS PER PLANS AND SPECIFICATIONS.

IV. PRELIMINARY SOIL MIX DESIGN INDICATING TYPE OF BINDER MATERIAL AND VOLUMETRIC PROPORTIONS FOR INITIAL TRIALS ON-SITE TO BE ADJUSTED BASED ON FIELD OBSERVATIONS AND EARLY STRENGTH RESULTS (SEE PART 3.2 TEST SECTION).

B. ACCURATE DAILY RECORDS OF THE WORK TO BE SUBMITTED BY CLOSE OF BUSINESS THE FOLLOWING DAY, INCLUDING:

I. COLUMN ID

II. DIAMETER

III. WORKING PAD ELEVATION

IV. MIXING DEPTH

V. START TIME

VI. TIME AT TIP ELEVATION

VII. FINISH TIME

VIII. MIXING DURATION

IX. GROUT MIX DETAILS (PERCENT WATER AND REAGENT BINDER)

X. GROUT INJECTION WITH DEPTH

XI. TOTAL INJECTED GROUT

XII. BLADE ROTATION NUMBER (BRN) WITH DEPTH

D. ANY PROPOSED CHANGE IN THE WORK PROCEDURES PLAN MADE NECESSARY BY CONDITIONS ENCOUNTERED DURING CONSTRUCTION FOR REVIEW AND APPROVAL BY THE ENGINEER.

E. MATERIAL CERTIFICATIONS FOR CEMENT BINDER TO BE USED IN THE PROJECT.

F. WEIGHTS: CERTIFICATES OF BATCH WEIGHTS FOR EACH TRUCK LOAD DELIVERED IF ON-SITE BATCH PLANT IS NOT USED.

G. ADMIXTURES/POZZOLANS/ADDITIVES SUBJECT TO THE APPROVAL OF THE ENGINEER, IF USED.

H. QC TEST RESULTS: SUBMIT ALL QC TEST RESULTS WITHIN 48 HOURS OF TESTING.

I. REPORT SUMMARIZING TEST SECTION RESULTS AND CALIBRATION OF DRILLING EFFORT CRITERIA FOR COLUMN DEPTH TERMINATION APPROVED BY THE ENGINEER.

J. AS-BUILT REPORT DOCUMENTING THE CONSTRUCTED LOCATIONS AND DIMENSIONS OF ALL DSM COLUMNS, COMPILATION OF ALL QUALITY CONTROL AND QUALITY ASSURANCE DATA COLLECTED FOR THE PROJECT, AND EXPLANATION OF ANY DEVIATION FROM THE PLANS AND SPECIFICATIONS PREVIOUSLY REVIEWED APPROVED TO THE SATISFACTION OF THE ENGINEER.

K. THE CONTRACTOR WILL SUBMIT A WORK PLAN DETAILING THE CONSTRUCTION AND QA/QC OF THE LTP, MEETING THE DESIGN REQUIREMENTS HEREIN AND IN THE GEOTECHNICAL REPORT.

1.5 ACCEPTANCE

A. ACCEPTANCE OF THE DSM WORK WILL BE BASED ON COMPLIANCE WITH THE STRENGTH AND GEOMETRY REQUIREMENTS OF THE PLANS AND SPECIFICATIONS AS VERIFIED BY THE ENGINEER'S QA TESTING. THE MATERIAL FORMED BY MIXING THE GROUT WITH THE IN SITU SOIL SHALL MEET A MINIMUM REQUIRED UNCONFINED COMPRESSIVE STRENGTH OF 150 POUNDS PER SQUARE INCH (PSI) AT 28 DAYS. TESTS WILL BE CONSIDERED PASSING IF THEY ARE AT LEAST 90% OF THE 150 PSI STRENGTH REQUIREMENT PROVIDED THAT NO MORE THAN 10% OF ALL TESTS FALL BELOW THE REQUIREMENT AND THE OVERALL AVERAGE STRENGTH EXCEEDS THE REQUIREMENT. IF THE UNCONFINED COMPRESSIVE STRENGTH RESULTS DO NOT MEET THAT CRITERIA, THE DSM SUBCONTRACTOR SHALL SUBMIT A MITIGATION PLAN FOR REVIEW AND APPROVAL BY THE ENGINEER.

PART 2 – PRODUCTS

2.1 MATERIALS

A. FRESH OR RECLAIMED WATER, FREE OF ANY DELETERIOUS SUBSTANCE THAT COULD ADVERSELY AFFECT THE GROUT PROPERTIES SHALL BE USED.

B. BINDER AGENT USED FOR THE PROJECT SHALL CONSIST OF PORTLAND CEMENT TYPE II/V CONFORMING TO ASTM DESIGNATION C150. THE CEMENT SHALL BE ADEQUATELY PROTECTED FROM MOISTURE AND CONTAMINATION WHILE IN TRANSIT AND STORAGE AT THE JOB SITE. RECLAIMED CEMENT OR CEMENT CONTAINING LUMPS OR DELETERIOUS MATTER SHALL NOT BE USED.

C. THE WATER AND CEMENT SHALL BE PREMIXED TO FORM A GROUT FOR INJECTION AND MIXING WITH THE IN-SITU SOIL. MATERIALS SHALL BE COMBINED IN PREDETERMINED WEIGHED PROPORTIONS WITH ITS QUALITY EVALUATED BY SPECIFIC GRAVITY MONITORED AT LEAST ONCE PER INSTALLATION BY MUD BALANCE.

D. THE DESIGN UNCONFINED COMPRESSIVE STRENGTH OF THE SOIL-CEMENT MATERIAL COMPRISING THE DSM COLUMNS IS 150 PSI AT 28 DAYS.

PART 3 – EXECUTION

3.1 EQUIPMENT

A. A PURPOSE BUILT HOLLOW STEM AND MIXING PADDLE TOOL ATTACHED TO A HIGH TORQUE ROTARY DRILL ON TRACKS SHALL BE USED TO ACCOMPLISH THE DSM. MIXING TOOLS OF 4- AND 6-FOOT-DIAMETER WILL BE IMPLEMENTED FOR THIS PROJECT. MIXING TOOLS SHALL CONSIST OF A MINIMUM OF FOUR (4) MIXING BLADES (4 PAIRS OF MIXING PADDLES).

B. CEMENT WILL BE STORED IN PURPOSE BUILT SILOS.

C. WATER SHALL BE MIXED WITH CEMENT IN A PURPOSE-BUILT WEIGH-BATCH MIXER TO PRODUCE SLURRY WITH A CONSISTENT SPECIFIC GRAVITY OR WATER:CEMENT RATIO FOR PROPER MIXING. JET VALVE MIXING OR OTHER CONTINUOUS MIXING METHODS WILL NOT BE ALLOWED.

D. GROUT SHALL BE DELIVERED TO THE MIXING RIG BY APPROPRIATELY SIZED POSITIVE DISPLACEMENT PUMPS. PROGRESSIVE CAVITY PUMPS SHALL NOT BE ALLOWED.

3.2 TEST SECTION

A. LOCATIONS: PRIOR TO INITIATING PRODUCTION WORK, DSM SUBCONTRACTOR SHALL INSTALL A MINIMUM OF TWO DSM COLUMNS WITH VARYING MIX DESIGN DOSAGE AT EACH OF THE SIX TEST SECTION LOCATIONS INDICATED ON THE PLANS.

B. EVALUATION GOALS: THE PURPOSE OF THE TEST SECTION IS TO EVALUATE THE FOLLOWING ITEMS PRIOR TO INITIATING PRODUCTION WORK. THE DSM SUBCONTRACTOR MAY PROCEED IMMEDIATELY TO PRODUCTION WHILE TEST SECTION EVALUATION RESULTS ARE PENDING BUT DOES SO AT ITS OWN RISK.

I. COLUMN DEPTH: COLUMN INSTALLATION DEPTHS FOR THE PROJECT ARE CONTROLLED BY THE DEPTH TO THE CAPISTRANO FORMATION CONTACT AS DESCRIBED IN SECTION 3.3.G. DURING TEST SECTION INSTALLATION ADJACENT TO EXISTING EXPLORATION DATA, DSM SUBCONTRACTOR SHALL MONITOR AND RECORD INDICATORS OF DRILLING EFFORT (E.G. ROTARY TORQUE APPLIED AND CROWD PRESSURE). DSM SUBCONTRACTOR SHALL PROPOSE A READILY IDENTIFIABLE METRIC SUBJECT TO THE ENGINEER'S APPROVAL FOR THE DRILL OPERATOR TO OBSERVE DURING INSTALLATION AS EVIDENCE OF ENCOUNTERING THE CAPISTRANO FORMATION.

II. MIX CONSISTENCY: DURING TEST SECTION MIXING THE DSM SUBCONTRACTOR AND ENGINEER SHALL OBSERVE

III. STRENGTH: A MINIMUM OF TWO WET-GRAB SAMPLES SHALL BE COLLECTED FROM EACH TEST SECTION COLUMN INSTALLED AT DEPTHS OF 1/3 AND 2/3 THE TOTAL INSTALLATION DEPTH. EACH SAMPLE COLLECTED SHALL BE CAST INTO CYLINDERS FOR UNCONFINED COMPRESSION STRENGTH TESTING AND EVALUATION AS DESCRIBED IN SECTION 3.4.B.

IV. LOAD TEST: DSM SUBCONTRACTOR SHALL CONDUCT A MINIMUM OF FOUR LOAD TESTS PER THE REQUIREMENTS OF THIS SPECIFICATION TO ASSESS THE 4-FOOT-DIAMETER DSM COLUMN GEOTECHNICAL CAPACITY ADJACENT TO EXPLORATORY TEST DATA. SEE PROPOSED LOAD TEST LOCATIONS ON SHEET GI-3.

3.3 CONSTRUCTION

A. INSTALL DSM COLUMNS AT THE LOCATIONS AND TO THE DEPTH INDICATED ON THE DSM PLAN.

B. HORIZONTAL ALIGNMENT: THE DSM COLUMNS SHALL BE CAREFULLY SURVEYED AND STAKED OUT PRIOR TO INSTALLATION. THE COLUMNS SHALL BE CONSTRUCTED WITHIN 4 INCHES OF THE LOCATIONS SHOWN ON THE DRAWINGS.

C. VERTICAL ALIGNMENT: VERTICAL ALIGNMENT OF THE AUGER STROKE WILL BE CONTROLLED BY THE EQUIPMENT OPERATOR. THE COLUMN VERTICALITY SHALL HAVE A TOLERANCE OF 1:50 MAXIMUM DEVIATION.

D. MIXING SHAFT SPEED: THE MIXING SHAFT SPEED (RPMS) SHALL BE ADJUSTED TO ACCOMMODATE AN ADEQUATE RATE OF MIXING SHAFT PENETRATION BASED ON THE DEGREE OF DRILLING DIFFICULTY. THE MIXING SHAFT SPEED CAN BE ADJUSTED ACCORDING TO DRILLING DIFFICULTY.

E. BOTTOM MIXING: THE BOTTOM OF THE COLUMNS SHALL BE DOUBLE MIXED BY RAISING THE MIXING SHAFTS FIVE FEET OFF THE BOTTOM AND THEN REINSERTING THEM FOR REMIXING.

F. GROUT TAKE: THE GROUT TAKE (OR INJECTION RATE) PER VERTICAL FOOT OF COLUMN WILL BE ADJUSTED TO THE REQUIREMENTS OF THE DESIGN MIX. APPROPRIATE DELIVERY PUMPS SHALL BE USED TO TRANSFER THE GROUT FROM THE MIX PLANT TO THE DSM RIG. A FLOW MONITORING DEVICE WILL BE INSTALLED IN THE GROUT LINE TO DETECT LINE BLOCKAGE AND ELECTRONICALLY RECORD INJECTION RATES AND VOLUMES VERSUS DEPTH AND TIME FOR QUALITY CONTROL MONITORING.

I. THE RATE OF APPLICATION MAY BE CONTROLLED AND MONITORED BY ADJUSTING THE PUMP OUTPUT TO THE PENETRATION RATE SO THAT A PRESET GROUT TAKE CAN BE ACHIEVED. TYPICALLY, THE APPLICATION RATE CAN BE SUCCESSFULLY CONTROLLED BY EXPERIENCED OPERATORS ONCE THE PATTERN OF OPERATION IS ESTABLISHED.

II. SOME VARIATIONS OF THE GROUT TAKE WILL OCCUR DUE TO FIELD CONDITIONS. HOWEVER, THE OVERALL APPLICATION RATE TO EACH STROKE CAN BE MONITORED, CALCULATED AND CONTROLLED. ADDITIONAL MIXING IS TO BE USED WHEN NECESSARY TO DISTRIBUTE THE GROUT THROUGH THE ENTIRE COLUMN. THE INJECTION OF GROUT TO EACH STROKE WILL BE MONITORED, CHECKED BY CALCULATION AND RECORDED.

G. COLUMN DEPTH:

I. BUTTRESS COLUMNS: COLUMNS INSTALLED FOR THE LATERAL SPREAD BUTTRESS SHALL BE INSTALLED TO A MINIMUM OF 4 FEET BEYOND THE CAPISTRANO FORMATION CONTACT AS IDENTIFIED BASED ON THE DRILLING EFFORT CALIBRATION PERFORMED DURING THE TEST SECTION WORK AND SUBJECT TO THE APPROVAL OF THE ENGINEER. PRACTICAL REFUSAL (AS DEFINED IN SECTION 3.3.H) ENCOUNTERED PRIOR TO ACHIEVING THE REQUIRED 4-FOOT EMBEDMENT INTO CAPISTRANO FORMATION MAY BE APPROVED BY THE ENGINEER ON A CASE-BY-CASE BASIS BUT THE DSM SUBCONTRACTOR SHALL BE PREPARED TO INITIATE PREDRILLING IF NEEDED TO ACHIEVE THE REQUIRED EMBEDMENT AT NO ADDITIONAL COST TO THE OWNER.

II. BUILDING SUPPORT COLUMNS: DSM COLUMNS INTENDED FOR SUPPORT OF THE RETAIL BUILDINGS SHALL BE INSTALLED TO A MINIMUM OF 1 FOOT BEYOND THE CAPISTRANO FORMATION CONTACT OR TO PRACTICAL REFUSAL. MEANS OF IDENTIFYING THE CAPISTRANO FORMATION CONTACT WILL BE BASED ON THE DRILLING EFFORT CALIBRATION PERFORMED DURING THE TEST SECTION WORK AND SUBJECT TO THE APPROVAL OF THE ENGINEER.

H. OBSTRUCTION/MIXING SHAFT PRACTICAL REFUSAL: IF OBSTRUCTIONS ARE ENCOUNTERED WHICH REDUCE THE RATE OF PENETRATION TO ONE FOOT PER MINUTE FOR TWO MINUTES UNDER FULL POWER, THE STROKE SHALL BE COMPLETED IN ACCORDANCE WITH THE SPECIFICATIONS AND REMEDIAL MEASURES WILL BE TAKEN. SUBCONTRACTOR SHALL NOTIFY CONTRACTOR TO INVESTIGATE, CONFIRM, AND REMOVE SAID OBSTRUCTIONS FROM THE SOIL MIXING AREA. ONCE CONTRACTOR REMOVES OBSTRUCTIONS AND BACKFILLS AND COMPACTS (IN LIFTS NOT TO EXCEED 3 FEET IN UNCOMPACTED THICKNESS) THE REMOVAL AREA WITH GRANULAR SAND OR SANDY GRAVEL MATERIAL, THE DSM SUBCONTRACTOR SHALL RETURN TO MIXING THE BACKFILLED AREAS AND REMAINING DSM COLUMNS PER PLANS AND SPECS. IF REMOVAL OF OBSTRUCTIONS BY CONTRACTOR DAMAGES A PREVIOUSLY INSTALLED DSM COLUMN, ASSOCIATED RE-INSTALLATION WORK SHALL BE COMPENSATED BY AS EXTRA AT THE CONTRACT UNIT PRICES. IF IT IS INFEASIBLE OR IMPRACTICAL TO CLEAR AN OBSTRUCTION FROM A DESIGN INSTALLATION LOCATION, CONTRACTOR MAY PROPOSE A MODIFICATION TO THE DESIGN PROVIDED THE ORIGINAL PERFORMANCE IS MAINTAINED SUBJECT TO THE REVIEW AND APPROVAL OF THE ENGINEER.

I. MIXING ENERGY: THE DSM SUBCONTRACTOR SHALL MIX EACH COLUMN WITH SUFFICIENT MIXING ENERGY THROUGHOUT TO PROPERLY PROCESS THE SOIL CEMENT PRODUCT. THE MIXING ENERGY SHALL BE DEMONSTRATED BY MEASURED AND RECORDED BRN REPORTED FOR EACH INSTALLATION AND THE MIXING ENERGY APPLIED SHALL MINIMALLY ACHIEVE THAT REQUIRED TO PRODUCE SATISFACTORY RESULTS DURING THE TEST SECTION.

J. NO EXCAVATION OR HEAVY GRADING BY CONTRACTOR SHALL PROCEED PRIOR TO 3 DAYS AFTER DSM COLUMN CONSTRUCTION UNLESS APPROVED BY THE DSM DESIGN ENGINEER.

K. UTILITY TRENCH: EXCAVATE THE COMPLETED DSM COLUMNS AS NECESSARY FOR UNDERGROUND UTILITIES. TRENCH BACKFILL WILL BE AS FOLLOW:

I. FOR TRENCHES CUT INTO BUTTRESS DSM AND ABOVE GWT: BACKFILL WILL NATIVE SOILS OR AS APPROVED BY THE ENGINEER.

II. FOR TRENCHES CUT INTO BUTTRESS DSM AND EXTEND BELOW GWT: BACKFILL WITH CEMENT SLURRY WITH COMPRESSIVE STRENGTH OF AT LEAST 300 PSI.

III. UTILITIES TRENCHES WILL AVOID CUTTING INTO THE DISCRETE 4' DIAMETER DSM COLUMNS SUPPORTING BUILDINGS AND SLABS.

L. MANAGEMENT OF SPOIL TO BE COORDINATED BETWEEN CONTRACTOR AND DSM SUBCONTRACTOR.

3.4 QUALITY CONTROL AND QUALITY ASSURANCE

A. PRIOR TO CONSTRUCTION, A PRELIMINARY MIX DESIGN SHALL BE GENERATED BY THE SUBCONTRACTOR. THE MIX DESIGN MAY BE OBTAINED BASED ON SITE SOILS AND LABORATORY TESTING, OR ALTERNATIVELY, BASED ON THE SUBCONTRACTORS DATABASE IN SIMILAR SOIL CONDITIONS AND STRENGTH REQUIREMENTS.

B. WET SAMPLING: THE DSM SUBCONTRACTOR SHALL OBTAIN WET BULK SAMPLES OF THE SOIL CEMENT MIX AND CAST IT IN CYLINDERS FOR SUBSEQUENT QUALITY CONTROL TESTING BY THE DSM SUBCONTRACTOR, AND QUALITY ASSURANCE TESTING AND ACCEPTANCE BY THE ENGINEER.

I. ONE SAMPLE WILL BE RETRIEVED PER WORK DAY PER RIG.

II. THE VOLUME OF SAMPLE RECOVERED DURING EACH SAMPLING SHALL BE SUFFICIENT TO CAST 6 SAMPLE CYLINDERS EACH MEASURING 3" DIAMETER BY 6" HIGH. A ½" SIEVE WILL BE USED TO SCREEN THE MATERIAL IN ORDER TO FACILITATE APPROPRIATE SCALING OF INCLUSIONS AND PROPER MODELING OF THE 3 INCH CYLINDERS.

III. OF THE 6 CYLINDERS CAST, 3 WILL BE PROVIDED TO THE ENGINEER FOR QUALITY ASSURANCE TESTING AND 3 WILL BE RETAINED BY THE DSM SUBCONTRACTOR FOR QUALITY CONTROL TESTING.

IV. TO AVOID DISTURBANCE, THE CYLINDERS ARE TO BE CURED ON SITE IN A COOLER WITH A SMALL AMOUNT OF WATER TO MAINTAIN A STABLE, COOL AND MOIST CURING ENVIRONMENT FOR 2 DAYS.

V. AFTER QUALITY ASSURANCE SAMPLES ARE RETRIEVED BY THE ENGINEER, ALL WET GRAB SAMPLES SHALL BE STORED IN A MOIST ROOM (NOT SUBMERGED) IN ACCORDANCE WITH ASTM C 192 UNTIL THE TEST DATE.

VI. THE QUALITY CONTROL SAMPLES WILL BE TESTED (BY THE DSM SUBCONTRACTOR) FOR UCS IN ACCORDANCE WITH ASTM D1633, AT 3-DAY, 7-DAY, AND 14-DAY AFTER CASTING. THE RESULTS WILL BE USED TO EXTRAPOLATE THE EXPECTED STRENGTH AT 28-DAYS.

VII. THE QUALITY ASSURANCE SAMPLES WILL BE TESTED (BY THE ENGINEER) FOR UCS IN ACCORDANCE WITH ASTM D1633, AT 7-DAY, 14-DAY, AND 28-DAY AFTER CASTING.

VII. WHEN TIME OR SCHEDULE DOES NOT PERMIT A 28-DAY CURING STRENGTH EVALUATION, THE FOLLOWING UCS AGING CORRELATION WILL BE TENTATIVELY APPLIED TO THIS JOB:

28 : 7 DAY, 1.57

VIII. THE ABOVE CORRELATION MAY BE ADJUSTED FOR SITE-SPECIFIC FINDINGS AS THE PROJECT DEVELOPS.

IX. THE DESIGN STRENGTH FOR THIS PROJECT AT 28-DAYS IS 150 PSI. SUBJECT TO THE APPROVAL OF THE ENGINEER, 7-DAY TEST RESULTS MAY BE ACCEPTED BASED ON THE CORRELATION ABOVE OR A REVISED CURING FACTOR BASED ON PROJECT-SPECIFIC STATISTICAL ANALYSIS OF AVAILABLE DATA.

C. LOAD TEST:

I. DSM SUBCONTRACTOR SHALL PERFORM A MINIMUM OF FOUR COMPRESSION LOAD TEST ON 4-FOOT-DIAMETER COLUMNS AT THE TEST SECTION LOCATION SPECIFIED FOR THE BUILDINGS ON THE DRAWINGS.

II. COMPRESSION LOAD TEST SHALL BE IN GENERAL ACCORDANCE WITH ASTM D1143. THE TEST COLUMN SHALL BE CONDUCTED TO AT LEAST 150% OF THE STATIC DESIGN LOAD.

III. LOAD TEST WILL NOT BE PERFORMED BEFORE THE COLUMN HAS ACHIEVED SUFFICIENT UNCONFINED COMPRESSIVE STRENGTH AS DEMONSTRATED BY LABORATORY TESTING ON WET GRAB SAMPLES.

D. OBSERVATION: A REPRESENTATIVE OF THE ENGINEER SHALL BE PRESENT FULL-TIME DURING ALL INSTALLATION WORK TO OBSERVE THE CONSTRUCTION OF THE DSM COLUMNS, SAMPLING, AND TESTING TO VERIFY THE DSM SUBCONTRACTOR PERFORMS THE WORK IN SUBSTANTIAL CONFORMANCE WITH THESE SPECIFICATIONS. THE ENGINEER SHALL MAINTAIN PARALLEL HAND RECORDS OF PERTINENT INSTALLATION DATA FOR COMPARISON WITH REPORTED INSTALLATION LOGS AND OBTAIN TEST SPECIMENS OF THE WET-SAMPLES COLLECTED FOR QUALITY ASSURANCE TESTING.

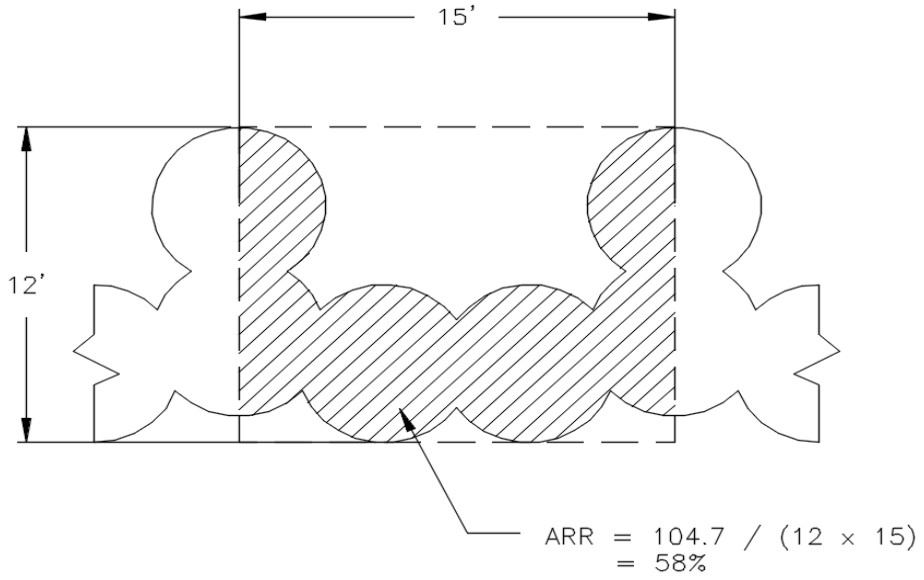
Determine composite shear strength of DSM buttress for use in pseudostatic slope stability anlysis
Lateral stread buttress

Geometry:



Input values:

ARR =	**58%**		Area replacement ratio
q_DSM28 =	**150**	psi	Design compressive strength of DSM at 28 days
fc =	**2**		Curing factor (long term)

Calculations:

q_DSM =	300	psi	Long term compressive strength of DSM for seismic condition
s_DSM =	150	psi	Shear strength of DSM = 1/2 compressive strength
=	21600	psf	
s_comp =	12528	psf	Composite shear strenght = s_DSM x ARR (Neglect shear strength of native soils)

Select conservative value of **7200 psf** to ensure strain compatibility

Downdrag Calculations per AASHTO LRFD Bridge Design (2012) - Drilled Shafts

Notes:

1. Please enter the required inputs shown in blue.
2. This spreadsheet should be used for drilled shafts, only.
3. The formulations are based on povisions of AASHTO LRFD Bridge Design, 2012 - Section 10.8.
4. Per section 10.8.3.5.2, Beta method is used for cohesionless material , where N60 is average SPT blow count corrected only for hammer efficiency.
5. Put zero values for Su and N60 if not applicable.
6. Units are all Imperial. The macro must be modified for metric units.
7. Do not add any row or column to this spreadsheet.
8. The spreadsheet is formulated up to row No. 6000.

Input Parameters

Pile Diameter =	4	ft	
Wall thickness	24.0	inch	Use D/2 for concrete piles
Elastic Young's Modulus =	12960.0	ksf	
Depth where FF settlement is 0.4" =	19.0	ft	
Column Depth =	20.0	ft	
Ground Water Table Depth =	10.0	ft	

Click below to run analysis

Calculate Downdrag Force & the Resulting Pile Elastic Compression

Outputs

Negative Friction (Downdrag) =	128.7	kips
Pile Elastic Compression=	0.02	inch
Ultimate Positive Friction =	12.6	kips
Ultimate End Bearing =	706.5	kips

PLAXIS Analysis of LTP Section

Building&Safety: Ryan Rose 12/11/2023
Approval: Geotechnical Reports
Permits: GRD21-0090

County of Orange - OC Public Works
OC Development Services
APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works, OC Development Services Department. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County ordinance or law.
Hadi Tabatabaee
BUILDING OFFICIAL

Static and seismic performance of the proposed LTP system under slab load of 300 psf was evaluated using the finite element computer program PLAXIS, 2D. The geometry of the FE modal was composed of two-dimensional (2D) plane-strain model of:

a. 4ft diameter DSM columns at 12ftx12ft spacing and 20ft deep;
b. Three (3) layers of 12" thick cement-treated fill with UCS=200psi;
c. Soil layers from the ground information collected from CPTs and borings.

The effective width of the DSM columns were taken as 1.05 ft in order to account for the three-dimensional effects in the 2D plain-strain model. Equivalent secant elastic parameters and shear strength of the native soils were obtained from the site investigation data. Table A below presents the input soil parameters.

Table A. Input Soil Properties for PLAXIS analysis.

Depth (ft)	Soil Type	Static Condition		Liquefied Condition	
		Secant Young's Modulus (ksf)	Shear Strength	Secant Young's Modulus (ksf)	Shear Strength
0 to 9	Af/Qm	400	Phi = 31, c = 395 psf	-	-
9 to 20	Af/Qm (below GWT)	400	Phi = 30, c = 80 psf	100	Phi = 5.7 deg
Below 20	Tc	3000	Phi = 34, c = 695 psf	-	-
-	LTP (UCS, 28day=200 psi)	7200	14400 psf	14400 (365 day UCS)	28800 psf (365 day UCS)
-	CDSM (UCS, 28day=150 psi)	6480	10800 psf	12960 (365 day UCS)	21600 psf (365 day UCS)

The main goal of the analysis was to ensure that the deformations are in a tolerable ranges and LTP system did not show any signs of failure in tension and compression under the slab load during static and seismic loadings. Geometry of the model, deformations and stresses are presented in the following pages.

PURPOSE

This report presents the results of our geotechnical investigation for the "Commercial Component" of the Dana Point Harbor Revitalization Project. The purpose of our investigation was to develop geotechnical recommendations pertaining to site grading and the design and construction of the proposed buildings and other site improvements (i.e., roadways, parking lots, trash enclosures, site walls, exterior concrete flatwork, miscellaneous site structures, etc.) Our investigation included performing laboratory testing, data analysis, and geotechnical engineering evaluation, and developing recommendations for geotechnical hazard mitigation and proposed building and improvement areas.

PROPOSED IMPROVEMENTS

The Commercial Component of the Dana Point Harbor Revitalization Project encompasses the retail and restaurant buildings. It is our understanding that the proposed development on the land side of the existing sea wall will consist of constructing eight (8) new retail/office/surf museum/restaurant buildings (Buildings 1, and 6-12), and renovating five (5) existing retail/restaurant buildings (Buildings 2-4, 5A, and 5B), along with a new parking area, landscape site structures, landscaping, small retaining walls, flatwork, and other appurtenant structures. We understand that the renovation of Buildings 2-4, 5A and 5B will generally consist of remodeling the existing buildings with new doors and windows and, on some of the buildings, removing interior walls to reconfigure their layout.

Plate 2 of this report shows the location of the structures. We understand from our review of the project precise grading plans prepared by TAIT Engineering that the grades for the new buildings will be raised by approximately 1 to 3 feet. The ocean side revitalization, consisting of boat slips, boater facilities, dry boat storage, day-boat parking, and launch ramp areas, as well as a proposed hotel area west of the Commercial Component, will be performed by others under a separate permit.

SITE LOCATION AND DESCRIPTION

The subject site is bounded by Dana Point Harbor Drive, the planned realignment of Golden Lantern, and the proposed parking structure and existing parking lot on the north, the existing boat launch ramp and Embarcadero Marina area on the east (which will be the future Dry Stack Storage Component site), the existing Casita Place and the existing Marina Inn on the west (which will be part of the future Hotel Component site), and the existing sea wall and harbor on the south (see Plate 1 – Location Map). The existing sea wall on the south or "ocean side" of the site is a "Quay" wall which consists of slightly battered, cantilevered, reinforced-concrete gravity wall constructed

Building&Safety: Ryan Rose 12/11/2023

Hadi Tabatabaee
BUILDING OFFICIAL

directly above 1.5:1 (horizontal to vertical) slopes. The slopes below the sea wall are comprised of riprap, with a concrete lining covering the ocean side riprap slope.

The majority of the site is relatively flat and drains by sheet flow towards the south to existing storm drain catch basins. However, there is an up to 16-foot-high, 2:1 (horizontal to vertical) slope along the north side of the site below Dana Point Harbor Drive, and an up to 14-foot-high, 2:1 (horizontal to vertical) slope along the west side of the site below Golden Lantern. The elevations of the flat portion of the site range from approximately 13.5 feet above mean sea level (msl) in the northern portion, to approximately 11 feet above msl in the southern portion. The site contains several existing buildings, with most of the site covered by either asphalt pavement or concrete flatwork, with some planters and landscape areas planted with flowers, groundcover, shrubs, and occasional trees.

BACKGROUND HISTORY AND PREVIOUS REPORTS

In order to research the site's history and geologic conditions, we reviewed published geologic maps and reports, previous geotechnical reports by other geotechnical consultants for the subject site and entire harbor area, and a previous report for the existing sea walls.

Based on our research, Dana Point Harbor is located within a cove (Dana Cove) that is bordered on the north by cliffs or bluffs that are approximately 100 to 200 feet high, and on the west by a hard, resistant promontory of land known as The Headlands. Prior to the construction of the harbor, the cove was bordered by a rocky shoreline along the base of the cliffs. However, due to the protection provided by The Headlands, a sandy shore was able to form toward San Juan Creek.

Dana Point Harbor was constructed in the late 1960s and early 1970s by the County of Orange and the United States Army Corps of Engineers. It is our understanding that the harbor was constructed by excavating the native soils after the cove was dewatered through the construction of a coffer dam. The construction of the coffer dam included the installation of sheet piling and the placement of fill in a wet condition. The harbor was then dewatered and the water basins were excavated to maximum depths of approximately 10 to 12 feet below sea level with the exception of local areas within the northern portion of the harbor where hard bedrock materials were encountered. Artificial fill was then placed in a relatively dry condition up to existing grades, and the sea walls, boat ramps, docks, and buildings were then constructed. In addition, a riprap breakwater was constructed along the south side of the harbor to protect it from wave action.

In order to provide access to the harbor, the shoreline cliffs were cut back to construct Dana Point Harbor Drive and Street of the Golden Lantern. These slopes were cut to gradients ranging from 1:1 (horizontal to vertical) to 2:1, depending on their geologic structure and material type.

BUILDING OFFICIAL

An evaluation of the existing sea walls was performed by Bluewater Design Group in December of 2003. Their evaluation indicated that most of the existing sea walls are "Quay" walls which consist of slightly battered, cantilevered, reinforced-concrete gravity walls constructed directly above 1.5:1 (horizontal to vertical) slopes composed of riprap. The harbor side of the slope is covered by concrete panels. The extent of the riprap on the non-harbor side is unknown; however, it is anticipated that it consists of a 1.5:1 (horizontal to vertical) slope composed of riprap with no concrete lining. As a result, the Quay wall footings are supported on either rock riprap or shallow fills placed on top of the riprap. The walls are not embedded into the ground and thus rely on their own weight, the weight of the soil over the heel, and the friction between the bottom of the footings and the underlying soil or riprap to prevent overturning and resist sliding forces. Most of the Quay walls are 5 feet in height; however, some local sections are 9 feet in height. The report by Bluewater Design Group also indicated that the north and south sides of the public boat launch ramp are supported by conventional cantilever retaining walls that range from 2 to 15 feet in height with footings founded into fill materials.

AERIAL PHOTOGRAPHY REVIEW

An aerial photo review of 20 sets of stereo-paired air photos spanning from 1952 through 1999 was performed for the subject site in order to assess historical land use and site development. (aerial photos were provided by Continental Aerial Photo). Photos taken prior to development of the harbor area show an undeveloped cliff bordered by a rocky shoreline and a relatively natural cove. In 1967, two jetties were constructed on the east and west sides of the cove. By 1970, the alteration of the cove into a man-made harbor was nearing completion and the roadways had been graded. The photos indicate that Dana Point Harbor Drive and the northerly areas of the harbor (generally parking lot and boat storage) are likely underlain by bedrock from the cut operation of the shoreline cliff. By 1975, the harbor appears to be essentially in its current condition with the existing buildings and paved areas. Photos reviewed after 1975 show no significant changes to the area.

SUBSURFACE EXPLORATION

GMU conducted a recent subsurface exploration program to evaluate the soil conditions within the project and surrounding areas. The recent subsurface explorations performed by GMU consisted of the following:

- Twenty eight (28) hollow-stem-auger exploratory drill holes by GMU to a maximum depth of 50 feet below the existing ground surface in order to determine site-specific subsurface geologic and groundwater conditions and to obtain bulk and drive samples for geotechnical testing.
- Seven (7) CPT soundings by GMU to a maximum depth of 26 feet below the existing ground surface.

The drill holes were logged by our Staff Geologist and samples were collected and transported to our facility for observation and testing. The drill holes and CPT locations are shown on Plate 2 – Composite Geotechnical Map. Drill hole logs are contained in Appendix A and CPT reports are presented in Appendix A-3.

Additionally, we have utilized previous geotechnical exploration data that was performed by GMU and by others. The previous drill hole logs by GMU are presented within Appendix A-1.; previous drill hole logs by others are presented within Appendix A-2; and previous CPT data performed by others are presented within Appendix A-4.

GEOLOGIC FINDINGS

GENERAL GEOLOGY AND SUBSURFACE CONDITIONS

Regional Geology

Published geologic maps indicate that prior to development, the site consisted of a natural cove that was protected by a hard, resistant promontory of land to the west known as The Headlands. The cove was bordered by a rocky shoreline along the base of steep sea cliffs. The sea cliffs are comprised of marine sedimentary rocks of the Capistrano Formation that are capped by marine and non-marine terrace deposits. The base of the sea cliffs was mantled by talus deposits and local deposits of artificial fill while the bottom of the cove was covered by marine deposits. The harbor was constructed by dewatering the cove, partially excavating the native soils along the base of the cliffs and within the cove, and then replacing the excavated materials as compacted fill and creating cut slopes to create roadways to the harbor.

Site-Specific Conditions

The subject site, including the proposed commercial buildings and other site improvements, are within the cove area of the harbor and is underlain by artificial fills, marine deposits, and bedrock of the Capistrano Formation. These materials are described in more detail in subsequent sections of this report.

BUILDING OFFICIAL

Artificial Fill (Qaf)

The artificial fill materials within the site originated from both the marine deposits and bedrock within the cove, and the talus deposits and bedrock materials along the base of the sea cliffs. As a result of the fill materials being comprised of a variety of different geologic units, the fill materials are highly variable and consist of frequently alternating layers of clayey sands, silty sands, sands, sandy clays, and sandy silts with gravel, isolated cobbles, and some scattered rock fragments greater than 6 inches in diameter. In general, the granular sand materials were found to be medium dense to dense while the fine-grained clay and silt materials were found to be predominantly firm to very firm. In addition, our laboratory testing indicates that the fill materials have varying degrees of compressibility and hydro-collapse.

Marine Deposits (Qm)

The marine deposit materials within the site are comprised of materials typically deposited in beach and submarine environments and, where encountered, generally consist of wet, medium dense, silty sands to sands. Marine deposits were encountered underlying the artificial fill within six of our current drill holes (DH-26, DH-29, DH-34, DH-35, DH-46, and DH-51).

Capistrano Formation (Tc)

Capistrano Formation bedrock was encountered below the fill and/or marine deposits in all our deeper drill holes and in all our CPT soundings. The bedrock was observed to consist predominantly of hard to very hard, fine- to coarse-grained, massive sandstones with occasional beds of moderately hard to hard, gray to very dark gray claystones and siltstones.

GROUNDWATER

Groundwater is present at shallow depths below the subject site. Review of the Seismic Hazard Zone Report for the Dana Point Quadrangle indicates that the historic high groundwater level is 5 feet below the existing grade at the project site. In our recent and previous subsurface explorations, groundwater was encountered at depths ranging from 5 to 16 feet below the existing grade. Groundwater levels were measured utilizing a measuring tape or groundwater sounder within the boring during drilling; however, for this investigation, drill holes were not left open for extended periods of time to allow the groundwater to reach equilibrium within the drill holes. In order to determine more accurate groundwater levels, laboratory testing was performed on samples collected during drilling in order to obtain the in-situ saturation levels of the onsite soils. The groundwater levels indicated on the drill hole logs are based on field observations combined with results from our laboratory testing. The groundwater levels shown on the cross sections represent a rough conservative average of the groundwater levels shown on the boring logs and represent a best-fit geologic model.

Hadi Tabatabaee
BUILDING OFFICIAL

To aid in the designing of the underground utilities and provide estimated groundwater levels that may be encountered by contractors, the groundwater levels shown on the cross sections were adjusted to account for average high tide conditions. These "estimated high tide" groundwater levels are shown on Plate 5. It should be noted that these groundwater levels should be used with caution as they do not account for King Tides, Maximum High Tides, and effects due to climate change.

The following table summarizes groundwater levels at the site:

Groundwater Levels Summary

Groundwater Condition	Basis	Use	Reference/ Value
Average groundwater levels	Groundwater levels encountered during exploration and adjusted for saturation and geologic model	General	Boring logs, Plates 2 & 3
Groundwater levels adjusted for daily high tides	Average groundwater levels adjusted for daily high tides	Underground utility design and likely high tide levels that may be encountered by contractors	Plate 5
Groundwater levels to be used for liquefaction and lateral spreading analyses	Boring logs, Plates 2 & 3, CGS Historic High GW Level	Geotechnical engineering design (i.e., liquefaction, lateral spreading, etc.)	5' bgs

Any construction extending below the depths shown on Plate 5 may encounter saturated conditions. Consequently, appropriate construction precautions should be utilized (i.e., deeper excavations for utility lines, etc.).

It should be further noted that the estimated groundwater levels represent our best interpretation of the information available at the time of this report. Consequently, actual groundwater levels at the time of construction may differ from the estimates presented in this report. It is up to the contractor to determine the groundwater levels at the time of construction. **The contractor is strongly encouraged to directly determine groundwater levels immediately prior to construction. The installation of a piezometer, which can be measured through tidal cycles, should be considered by the contractor.**

GEOLOGIC HAZARDS

FAULTING AND SEISMICITY

The site is not located within a published Alquist-Priolo Earthquake Fault Zone, and no known active faults are shown on current geologic maps as crossing the site. The nearest known active fault is the offshore segment of the Newport-Inglewood fault, which is located approximately 2.5 miles southwest of the site and is capable of generating a maximum earthquake magnitude (M_w) of 7.5. The site is also located 9.5 miles from the San Joaquin Hills Blind Thrust, which is capable of generating a maximum earthquake magnitude (M_w) of 7.1.

The site has been subject to local earthquakes including the 1933 Long Beach Earthquake with a 6.4 magnitude, and the 1997 Northridge Earthquake with a 6.7 magnitude. An earthquake search indicated that approximately 37 earthquakes with magnitudes greater than 5 occurred within a 100-kilometer (~ 62 miles) radius from the site within the past 200 years. Given the proximity of the site to these and numerous other active and potentially active faults, the site will likely be subject to earthquake ground motions in the future.

LIQUEFACTION

The site is located within a zone of required investigation for liquefaction as shown on the Seismic Hazard Zone Map for the Dana Point Quadrangle (CGS, 2001). Consequently, and also based on the conditions encountered in the subsurface explorations for this project, the site may be subject to seismic settlement and lateral spreading related to liquefaction. Liquefaction, seismic settlement, and lateral spreading were quantitively analyzed as part of this investigation, with the results discussed under the "Geotechnical Engineering Findings and Analyses" section of this report (Page 9).

LANDSLIDES

Based on our review of available geologic maps, literature, topographic maps, aerial photographs, and our subsurface evaluation, no landslides or related features underlie the site; however, an earthquake-induced landslide is mapped near the proposed development within the existing bluffs where surficial instability and cracking may occur. However, based on the distance between the bluffs and the project site, there is no potential for landslides to impact the proposed development.

TSUNAMI, SEICHE, AND FLOODING

Tsunamis

Tsunamis or seismic sea waves that have affected coastal Southern California are generally produced by submarine fault rupture. Historical records indicate that the coast from San Pedro to Newport Bay, has been affected by six significant tsunamis since 1868 (Vasily Tito, National Oceanographic and Atmospheric Administration, Personal Communication, June 1998). The largest waves were on the order of 6 to 8 feet. The most extensive recent damage occurred in harbor areas such as Los Angeles (Alaska - 1964, Chile - 1960).

Legg et al. (2004) investigated the tsunami hazard associated with the Catalina fault offshore of Southern California. They simulated tsunamis based on co-seismic deformation of the sea floor and estimated that coastal run-up values are 5 to 13 feet, although run-up could exceed 23 feet depending upon amplification due to bathymetry and coastal configuration. Large earthquakes on the Catalina fault are relatively infrequent, with recurrence intervals of several hundred to thousands of years (Legg et al., 2004).

Tsunami Inundation Maps

In 2009, the California Emergency Management Agency, California Geological Survey, and University of Southern California partnered in an effort to create tsunami inundation maps for California. The tsunami inundation maps were generated through a modeling process that utilizes the Method of Splitting Tsunamis (MOST). This computational program models tsunami evolution and inundation based on bathymetry and topography. The modeling also utilizes a variety of tsunami source events, including "realistic local and distant earthquakes and hypothetical extreme undersea, near-shore landslides" (California Emergency Management Agency et al., 2009). Using the source, bathymetry, and topography, the tsunami modeling yields a maximum inundation line. It is important to note that the published map does not represent inundation from a single event, but rather is the result of combining inundation lines from multiple source events. Therefore, the entire inundation region will likely not be inundated during a single tsunami event (California Emergency Management Agency et al., 2009).

The Tsunami Inundation Map states that the "tsunami inundation map was prepared to assist cities and counties in identifying their tsunami hazard. It is intended for local jurisdictional, coastal evacuation planning uses only." Furthermore, the map conveys that it is not intended for regulatory purposes. With respect to probability, the map states that it contains "no information about the probability of any tsunami affecting any area within a specific period of time."

A Tsunami Inundation Map for Emergency Planning was published for the Dana Point Quadrangle (California Emergency Management Agency et al., 2009). It is critical to note three points: (1) the map is only intended for emergency planning and evacuation planning; (2) the map does not

Hadi Tabatabaee
BUILDING OFFICIAL

convey any information with respect to probability or timing of tsunami events; and (3) the inundation line is a conservative combination of multiple source events.

Tsunami Hazard Assessment

As shown on the attached Plate 4 – Tsunami Inundation Map, the proposed site is located within a tsunami inundation area. Therefore, it should be anticipated that the site will be directly affected by a tsunami. Although the probability and severity of tsunami inundation in the lowland areas cannot be estimated based on current available information, tsunami evaluation performed by others suggests that tsunami waves could potentially impact and scour the new building foundations during a tsunami event. This potential tsunami scour and foundation loss of strength were considered in the foundation recommendations developed for the site.

Seiches

The potential for the site to be adversely impacted by earthquake-induced seiches is considered to be high due to the presence of significant enclosed bodies of water located in the vicinity of the site.

Flooding

According to the County of Orange FEMA Flood Insurance Rate Map, the site is located within "Zone X", an area of 0.2% annual chance flood, 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile, and protected by levees from 1% annual chance flood. The potential for the site to be adversely impacted by significant flooding is considered low.

GEOTECHNICAL ENGINEERING FINDINGS AND ANALYSES

LIQUEFACTION ANALYSES

Seismic Input

Based on 2019 CBC requirements, the peak ground acceleration (PGA_M) for the Maximum Considered Earthquake (MCE) event was used for the liquefaction evaluation. The PGA_M of 0.66g and a mean magnitude of 6.8 were considered for this study.

Liquefaction Evaluation and Seismic Settlement

The site is located within a zone of required investigation for liquefaction as shown on the Seismic Hazard Zone Map for the Dana Point Quadrangle (CGS, 2001).

Liquefaction analyses were performed based on the 2019 CBC and ASCE 7-16 criteria. A historic high groundwater depth of 5 feet was used in the analysis.

Given that CPT results provide a more reliable, accurate and continuous database from which to calculate liquefaction magnitude (i.e., relative to SPT-based analyses), our liquefaction analyses is based on CPT soundings. A liquefaction evaluation was performed on each CPT by means of CLiq, v.2.3.1.15 software and the Robertson (2009) methodology and are presented in Appendix D. Liquefaction analyses based on Standard Penetration Test (SPT) blowcounts were also performed as a cross-check. The SPT-based analysis provided a settlement estimate that was consistent with the results of the CPT analysis.

Based on our seismic settlement analysis and review of overall soil conditions, the earthquake-induced (EQ-induced) settlement is estimated to be 0.75 inch for the MCE event. A differential EQ-induced settlement of 0.5 inch over a span of 40 feet should be prudently considered in the design of the structures.

LATERAL SPREAD ANALYSES

Lateral Spreading and Cyclic Mobility

The proposed development is located within the vicinity of the existing sea wall and harbor where free face geometry and localized areas of shallow liquefiable soils exist. As a result, lateral spread analyses were performed to determine the potential of flow failure to occur during the MCE event. The lateral displacement was analyzed utilizing Cross Sections A-A', C-C', and D-D' for the MCE seismic loading.

Our evaluation included evaluating the stability of each section, post-earthquake, using the residual shear strength of the potentially liquefiable soils, estimating the yield acceleration for the section, and assessing the seismic deformations under liquefied condition which may be considered as an upper bound for the seismic deformations. Slope/W 2020 software was used for the slope stability analysis. Bray and Travasarou (2000) and Rathja and Antonakos (2011) procedures were used for evaluating the seismic displacements.

Our analyses revealed that the post-earthquake slope stability safety factors are less than 1.0 with the liquefied residual shear strengths, indicating a very high potential for earthquake-induced flow failure. Additionally, based on our post-earthquake deformation analyses, the lateral spread deformation was calculated to be greater than 90 inches on average, thus indicating that ground

Hadi Tabatabaee
BUILDING OFFICIAL

mitigation is required to reduce lateral deformations to levels compatible with the proposed foundation design.

Based on our analyses and findings, numerous lateral spread remediation schemes were evaluated. The most viable remediation scheme consisted of the placement of a Deep Soil Mixing (DSM) buttress between proposed Buildings 6-12 and the existing sea wall, as well as placing the building foundations on DSM piles. In the case of Building 1, the DSM buttress was integrated into the piles below the building due to lack of space for a buttress. More details of the design are contained in subsequent sections of this report.

We note that the DSM columns are designed to provide lateral support for improvements that are located inside the DSM buttress mitigation zone in the event that lateral spreading occurs. Consequently, non-structural improvements such as hardscape and utilities, including the portion of the sea wall seaward of the DSM buttress, are prone to lateral spreading and potential damage.

SOIL EXPANSION

The expansion potential of the surficial soils mantling the site (i.e., the artificial fills that will impact the proposed improvements) are highly variable, ranging from very low to medium. Consequently, the design of the exterior hardscape features should consider a medium expansion potential.

SOIL CORROSION

Corrosion

Based on the test results for pH, soluble chlorides, sulfate, and minimum resistivity of the site soils obtained during our subsurface investigation, the on-site soils should be considered to have:

- A moderate sulfate content or "S1" sulfate exposure to concrete per ACI 318, Table 19.3.1.1. This should be utilized for all concrete above the groundwater table shown on Plate 5.
- A low minimum resistivity indicating conditions that are severely corrosive to ferrous metals.
- A moderate to high chloride content (corrosive to severely corrosive to ferrous metals).

The results of the laboratory chemical tests performed within the site are included in Appendix B.

Hadi Tabatabaee
BUILDING OFFICIAL

Concrete Structures Exposed to Seawater

Due to the close proximity of the proposed improvements to the existing harbor and the potential for groundwater fluctuation, we anticipate that some concrete may be in contact with seawater and thus may be exposed to seawater chlorides. Therefore, concrete exposure of W1 and C2 in accordance with ACI 19.3.1.1 should be expected and considered in the concrete design for any concrete structures that may be deep enough to encounter groundwater as determined from Plate 5 (i.e., concrete storm drain pipe, etc.)

STATIC SETTLEMENT / COMPRESSIBLITY

Buildings

Static settlement will be induced by the introduction of new building loads. The underlying artificial fill and marine deposit soils encountered are moderately to slightly compressible under static loading. However, the geotechnical engineering characteristics of the underlying surficial soils are highly variable. Given this variability, and in order to: 1) minimize lateral spreading, 2) minimize foundation scour during a tsunami event, and 3) provide a uniform support of new building foundations, it was determined that DSM columns along with soil cement Load Transfer Platform (LTP) would provide an adequate support for the new buildings.

Given that the foundations will bear onto DSM columns, building foundation settlements will be minimal. Additionally, since the interior concrete slabs will bear on soil cement LTP which is designed to span between the DSM columns below the foundations, settlements are also expected to be minimal. However, local vertical seismic settlements that exceed the estimated values could occur during a maximum considered earthquake, inducing minor building slab distress.

Detailed settlement estimations for the building foundations were performed by Advanced GeoSolutions, Inc. (AGI) and are contained in their design submittal (submitted under separate cover). GMU has reviewed AGI's settlement analysis and confirmed that it is in general conformance with the recommendations provided in this report. The magnitude of the total and differential settlements are provided within the "Geotechnical Slab and Foundation Recommendations" section of this report (Page 24).

PRELIMINARY INFILTRATION TESTING

Seventeen (17) preliminary infiltration tests were performed in general conformance with the County of Orange Technical Guidance Document (TGD). The drill holes, shown on the attached Plate 2 – Composite Geotechnical Map, were excavated to depths of approximately 3.25 to 7.0 feet below the existing grade using a hollow-stem-auger drill rig. The calculated unfactored raw observed infiltration rates are presented in the following table.

Hadi Tabatabaee
BUILDING OFFICIAL

Infiltration Rates Results Summary

Drill Hole	Depth Below Finish Grade (feet)	Unfactored Raw Observed Infiltration Rates (inches/hour) *
GMU 17-206-02		
DH-5	5.0	0.04
DH-7	5.0	0.05
DH-8	5.0	0.03
DH-9	5.0	0.03
DH-10	5.0	0.07
DH-13	5.0	0.29
DH-14	5.0	0.10
DH-17	5.0	1.19
DH-18	5.0	0.28
DH-19	4.0	0.01
DH-20	5.0	0.07
DH-21	5.0	0.10
DH-22	5.0	0.24
DH-23	5.0	0.11
DH-24	5.0	0.05
GMU 11-161-00		
DH-10	3.25	0.35
DH-22	7.0	0.04

**Rates do not incorporate a factor of safety.*

The results of the infiltration testing indicate that the unfactored raw observed infiltration rates range from 0.01 to 1.19 inches per hour, with an average unfactored infiltration rate of 0.18 inch per hour. ***Thus, we conclude that infiltration rates for the entire site do not meet the minimum requirement of 0.3 inch/hour when a minimum factor of safety of 2 is applied per the County of Orange TGD manual.*** The preliminary infiltration test hole locations are shown on the attached Composite Geotechnical Map, Plate 2. The results of the infiltration testing are contained in Appendix C of this report.

EXCAVATION CHARACTERISTICS

The artificial fill soils and bedrock materials underlying the site can be easily excavated with conventional grading equipment such as dozers, loaders, excavators, and backhoes. We expect that excavation of new utility trenches can be accomplished utilizing conventional trenching machines and backhoes. Furthermore, groundwater may be encountered (see Plate 5).

CONCLUSIONS

Based on the geologic and geotechnical findings, it is our opinion that the proposed development is feasible and practical from a geotechnical standpoint if accomplished in accordance with the County of Orange grading and building requirements and the recommendations presented herein. It is also the opinion of GMU Geotechnical that the proposed grading and construction will not adversely affect the geologic stability of adjoining properties provided grading and construction are performed in accordance with the recommendations provided in this report. A summary of conclusions is as follows:

1. The project area is not underlain by any known active faults. Seismic structure design should be in accordance with the 2019 CBC based on ASCE 7-16.

2. As described in detail in the "Groundwater" section of this report (Page 5), groundwater may be as high as 5 feet bgs and is anticipated to impact construction of the DSM columns and excavations for deep utility lines; however, it is not anticipated to impact corrective grading. Plate 5 – Design Groundwater Level Plan, was developed to provide a guide to determining the depth to groundwater for construction.

3. The potential for lateral spreading is considered very high within the limits of the proposed development. Therefore, mitigation for lateral spreading utilizing DSM columns will be required.

4. The site will be subject to low magnitude seismic settlement, therefore settlements should be incorporated into the structure design.

5. The proposed Buildings 1, and 6 through 12 foundations may be subject to significant differential static settlements due to compression resulting from the fill variability. Therefore, ground improvement consisting of DSM columns for direct support of shallow foundations is recommended.

6. The proposed Buildings 2 through 5 renovation may be supported on a conventional slab-on-grade foundation system that is compatible with the existing foundations and slabs.

7. The near-surface site soils are anticipated to have a low to medium expansion potential (EIs 19 to 84) based on our recent laboratory test results and local experience.

8. Given the fill variability and potential disturbance from the demolition of existing structures, corrective grading will be required in all areas of the site – i.e., below building areas and landscape areas.

APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works. OC Development Services of Orange County. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

9. Corrosion testing indicates that the on-site soils have a moderate sulfate exposure level and are corrosive to buried ferrous metals and reinforcing steel. In addition, concrete structures below the groundwater table may be exposed to seawater, thus requiring special recommendations. Consequently, restriction on the type of cement, water to cement ratio, and compressive strength is required per ACI 318. Additionally, any metal exposed to the soil will need protection.

10. Based on the above Conclusion Items 3 through 9, the following remediation measures will be required: 1) corrective grading beneath the entire site, 2) a DSM column buttress along the sea wall in conjunction with DSM columns below Buildings 6-12 to minimize lateral spreading to 3 inches or less (Note: for Building 1, the DSM buttress was integrated into the DSMs below the building), 3) DSM columns below Buildings 1 and 6 through 12 foundations, 4) a 3-foot layer of cement-treated LTP within Buildings 1 and 6 through 12 pads to span the artificial fill between DSM columns for slab support, and 5) use of a conventional foundation system for the renovation of Buildings 2 through 5.

11. Based on our infiltration testing, infiltration of water into the subsurface soils is deemed not feasible in accordance with the County of Orange TGD manual.

RECOMMENDATIONS

REQUIRED GEOTECHNICAL MITIGATION SUMMARY

The following summarizes the required geotechnical mitigation for the site improvements:

- Lateral Spread Mitigation
  - A buttress of DSM columns will be required between the sea wall and Buildings 6 through 12. The DSM buttress will be set back 20 feet from the sea wall to minimize the potential for encountering existing riprap. Given that a conventional foundation and slab-on-grade foundation system was selected, the DSMs will be designed to reduce lateral spread deformations to 3 inches or less.
  - For Building 1, the DSM buttress was integrated into the design of the DSM columns below the building.

- Buildings 1, and 6 through 12
  - Foundations are to be supported on DSM columns due to:1) fill variability and related differential movements (both expansion and settlement), 2) seismic settlement, 3) lateral spread, and 4) tsunami scour.
  - Slab-on-grade to be supported on a Load Transfer Platform consisting of a 3-foot section of cement-treated soil designed to span between the DSM columns.

The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

- Buildings 2 through 5A and 5B
  - Conventional shallow foundation system.
  - Removed and recompacted or slurry fill below the foundations.

- Flatwork, Pavements, Site Improvements
  - Supported by removed and recompacted engineered fill.

The following summarizes the construction sequence of the required geotechnical mitigation:

- Construction of DSM columns for the buttress and Buildings 1, and 6 through 12.
- Corrective grading of the entire site.
- Raise grades to final grade elevation (i.e., 1-3 feet above existing grades) and construction of the LTP beneath Buildings 1, and 6 through 12.
- Construction of buildings and improvements.

SITE PREPARATION

Following demolition, all significant organic material such as weeds, brush, tree branches, or roots, or construction debris such as old irrigation lines, asphalt concrete, and other decomposable material should be removed prior to the start of the construction of the DSM columns. No rock or broken concrete greater than 6 inches in diameter should be utilized in the fills.

LATERAL SPREADING MITIGATION

As discussed previously, the DSM columns are designed to reduce the lateral spread deformation to 3 inches or less in order to eliminate the need for tying of the building foundation elements in all directions in accordance with ASCE 7-16. Design of the DSM columns is provided by AGI and was reviewed by GMU and found to be in general conformance with the recommendations provided in this report. In general, the DSM buttress columns that are planned in front of Buildings 6-12 and behind the sea wall will be 6 feet in diameter, will extend a minimum of 4 feet into competent bedrock, and will be overlapped to create a continuous 12-foot-wide buttress. The buttress is planned to be set back a minimum of 20 feet from the back of the existing sea wall in order to minimize encountering the existing riprap that is supporting the sea wall; however, it should be noted that the extent of the existing riprap is currently unknown, and isolated areas of riprap may be encountered within the 20-foot zone. As previously discussed, the DSM buttress columns below Building 1 will be integrated into the DSM columns below the building (see next section). Additionally, in order to relieve hydrostatic pressure, slot-cut trenches are planned at approximately 15-foot on-center as shown on AGI's ground improvement plans.

A copy of AGI's ground improvement plans and specifications are attached as Appendix G of this report.

BUILDING OFFICIAL

BUILDINGS SUPPORTED BY DSM

In addition to the DSM columns that are planned within the buttress zone behind the existing sea wall, DSM columns are also planned to support the proposed Buildings 1, and 6 through 12. The DSM columns for Buildings 6 through 12 are planned to be 4 feet in diameter and will be embedded 12 inches into bedrock or refusal, whichever occurs first. For Building 1, the DSMs below the building will consist of: 1) an outer row of 6-foot-diameter DSMs at the perimeter of the building, and 2) interior 4-foot-diameter DSM columns. All DSM columns for Building 1 will be embedded 12 inches into bedrock.

The building DSM columns design provided by AGS is presented as Appendix G of this report.

GRADING

General

The following recommendations pertain to any required grading associated with the proposed improvements and corrective grading needed to support the proposed improvements. All site preparation and grading should be performed in accordance with the County of Orange grading code requirements and the recommendations presented in this report.

Corrective Grading

In all areas of the site, corrective grading should consist of removal and recompaction of 2 feet below the existing ground surface. More detailed recommendations are contained below to ensure that all required corrective grading is performed for each type of improvement. However, it is envisioned that the blanket 2-foot removal will create the necessary corrective grading for all structures. Detailed recommendations for the soil cement LTP are also provided below.

<u>Buildings 1, and 6 through 12 Pads (Existing Grade Treatment)</u>

Corrective grading for the Building 1, and 6 through 12 pads, including the construction of the Load Transfer Platform (LTP) should be performed in accordance with the following recommendations:

- The subgrade within the proposed building pads should be excavated to a depth of 2 feet below the existing grade prior to raising of the grade. The excavation should extend laterally a minimum of 2 feet outside the edge of the buildings envelope.
- The bottom of the over-excavation should then be scarified to a depth of at least 8 inches, moisture conditioned to least 2% above optimum moisture content, and recompacted to at least 92% relative compaction.

APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works, OC Development Services of Orange County. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

- Following the approval of the over-excavation bottom by a representative of GMU, the onsite material mixed with the design cement content may be used as fill material to achieve the planned LTP elevation (i.e., minimum of 3 feet).
- The LTP construction should be performed in accordance with the general recommendations provided in the next section.
- Building pads that require additional fill to achieve the design grade (fill over the LTP), the onsite soil may be used as fill, provided that it is moisture conditioned to 2% above optimum moisture content and compacted to achieve 92% relative compaction.
- Fill paced above the LTP and supporting the new slabs should be tested by GMU to confirm that the expansion index (EI) of the material is less than 50.

Buildings 1, 6-12 Pads (Load Transfer Platform)

After the completion of the corrective grading, a 3-foot section of cement-treated LTP should be constructed in accordance with the following recommendations:

- The LTP, consisting of a soil-cement mixture, shall be placed over the properly recompacted subgrade.
- The minimum thickness of the LTP shall be 3 feet and extend to the edge of the building foundations envelope.
- The 3-foot-thick section of soil-cement shall be constructed in 3 lifts, with each lift having a compacted thickness of no more than 12 inches.
- A mix design shall be performed by the contractor to determine the required amount of cement for the section to achieve a 28-day unconfined compressive strength of 200 psi.
    - Based on the soil types encountered during our subsurface investigation, we anticipate that 6 percent cement can be used for bidding purposes.
    - Final mix design and cement content shall be provided by the contractor prior to performing the work and should be reviewed by GMU.
- The cement shall be dry mixed using a pulverizer. Homogenous mixing of the cement is crucial and requires proper equipment to achieve.
- Following dry mixing, perform a second mixing process with the introduction of water to hydrate the cement, if additional moisture is needed. The moisture content of the mixture must be approximately 1% to 3% above optimum moisture content. From the time the initial addition of water occurs, the material should be fully mixed (dry and wet) and compacted within 2.5 hours or less.
- Compaction of each lift of soil-cement should be performed using a large sheepsfoot compactor. Each lift of cement-treated soil shall be compacted to at least 92% of the maximum dry density as determined by ASTM D 1557.

Hadi Tabatabaee
BUILDING OFFICIAL

- The surface of the treated material should wetted at least three times daily (possibly more depending on weather) to maintain a moist surface condition and promote proper curing.
- For at least 24 hours after completion of compaction, heavy traffic on the surface should be minimized to the maximum extent possible, and heavy construction equipment traffic should be completely avoided to prevent breakdown of the treated material prior to the curing process being complete. After 24 hours, the surface should be proof-rolled and checked for yielding under heavy rubber-tire vehicle loads (such as a fully-loaded water truck). If the surface indicates signs of yielding or instability, an additional 24 hours of curing time should be implemented, again minimizing heavy traffic loading.

Please refer to the attached Plate 7 for details of the typical DSM and LTP installation.

Buildings 2 – 5A & 5B Foundation / Slab-On-Grade

Based on our understanding that minor improvements such as construction of new interior and exterior walls with new footings and slab-on-grade may take place within the existing Buildings 2 through 5, we recommend that any new footings and slab-on-grade be supported on engineered fill in accordance with the following recommendations:

- The new footings/slab-on-grade should be excavated to a depth of 2 feet below the bottom of footing or bottom of slab.
- The bottom of the over-excavation should then be scarified to a depth of at least 6 inches, moisture conditioned to least 2% above optimum moisture content, and recompacted to at least 92% relative compaction.
- Following the approval of the over-excavation bottom by a representative of GMU, the onsite material may be used as fill material to achieve the planned foundation bottom elevation.
- The fill material should be placed in 6- to 8-inch-thick lifts, moisture conditioned to 2% above optimum moisture content, and compacted to achieve 92% relative compaction.

As an alternative to the removal and recompaction of the onsite soils, particularly for new footing areas, the excavated 2 feet of soil may be replaced with a 2 sack sand-cement slurry.

Grading of All Areas Outside Building Footprints (Landscape and Hardscape Areas):

- Corrective grading in all areas outside Buildings 6 through 12 will consist of the removal and recompaction of 2 feet bgs.
- Local areas of deeper removal and recompaction may be required based on the requirements for: 1) miscellaneous site appurtenant structures/site retaining walls, 2) vehicular pavement, and 3) flatwork/hardscape/pedestrian pavers (see next sections).

BUILDING OFFICIAL

- **Fills to bring the landscape areas up to grade shall not consist of spoils from the DSMs or LTP as this could create long-term perched water problems.**

Miscellaneous Site Appurtenant Structures / Site Retaining Walls

Grading recommendations for miscellaneous site appurtenant structures and site retaining walls should consist of the following:

- The foundations for appurtenant structures should be over-excavated to a depth of at least 24 inches below the bottom of the foundations.
- The bottom of the over-excavation should then be scarified to a depth of at least 6 inches, moisture conditioned to least 2% above optimum moisture content, and recompacted to at least 92% relative compaction.
- Following the approval of the over-excavation bottom by a representative of GMU, the onsite material may be used as fill material to achieve the planned foundation bottom elevation.
- The fill material should be placed in 6- to 8-inch-thick lifts, moisture conditioned to 2% above optimum moisture content, and compacted to achieve 92% relative compaction.

Vehicular Pavement

Grading recommendations for the new vehicular pavement areas should consist of the following:

- The vehicular pavement section should be over-excavated to a depth of at least 12 inches below the bottom of the pavement section (i.e., 12 inches below the bottom of the aggregate base).
- The bottom of the over-excavation should then be scarified to a depth of at least 6 inches, moisture conditioned to least 2% above optimum moisture content, and recompacted to at least 92% relative compaction.
- Following the approval of the over-excavation bottom by a representative of GMU, the onsite material may be used as fill material to achieve the planned subgrade elevation. Spoil generated by the construction of the DSMs or LTP may also be used to bring the subgrade up to the bottom of the structural pavement section.
- The fill material should be placed in 6- to- 8-inch-thick lifts, moisture conditioned to at least 2% above optimum moisture content, and compacted to achieve 92% relative compaction.

Hadi Tabatabaee
BUILDING OFFICIAL

Flatwork/Hardscape/Pedestrian Pavers

Grading recommendations for the new concrete flatwork/hardscape/pedestrian pavers areas should consist of the following:

- The flatwork/hardscape/pedestrian pavers section should be over-excavated to a depth of at least 12 inches below the bottom of the pavers sections (i.e., 12 inches below the bottom of the aggregate base).
- The bottom of the over-excavation should then be scarified to a depth of at least 6 inches, moisture conditioned to least 2% above optimum moisture content, and recompacted to at least 92% relative compaction.
- Following the approval of the over-excavation bottom by a representative of GMU, the onsite material may be used as fill material to achieve the planned subgrade elevation.
- The fill material should be placed in 6- to- 8-inch-thick lifts, moisture conditioned to at least 2% above optimum moisture content, and compacted to achieve 92% relative compaction.
- The flatwork sections should be placed on either a 4-inch-thick layer of crushed miscellaneous base (CMB), crushed aggregate base (CAB), or imported granular material with an EI of 50 or less. To bring the flatwork grade up to within 4 inches of the bottom of the flatwork, spoils from the DSMs or LTP construction may be used, provided that the material is moisture conditioned to 2% above optimum moisture content and compacted to achieve 92% relative compaction.

Additional Grading Recommendations

If existing loose fill materials are found to be disturbed to depths greater than the proposed remedial grading, the depth of excavation, scarification, and re-compaction should be increased accordingly in local areas as recommended by GMU. GMU will need to provide site-specific recommendations based on their observations in the field.

Dewatering

Groundwater is not anticipated to be encountered during corrective grading. However, groundwater should be anticipated during installation of deeper utilities and should be pumped from utility trenches prior to placement of slurry. Final evaluation as to the need for and type of dewatering should be made by the contractor immediately prior to grading. It is recommended that groundwater monitoring be performed prior to the start of construction.

Volume Change

In order to aid in planning for the anticipated grading, we estimate that the change in volume of on-site disturbed surficial fills that are excavated and placed as new compacted fill at an average

The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

relative compaction of 92% will result in volume losses ranging from approximately 5% to 10%. For rough planning purposes only, an average volume loss of 7.5% may be assumed.

GRADING AND APPROVAL PROCEDURES

Based on discussions with the County of Orange, facilitated by the Geotechnical Reviewer Mr. Ryan Rose, the grading will be processed under a single precise grading permit. However, individual building pad releases will be granted on a per-pad basis upon completion of the following items for each building pad:

- Demolition
- Installation of Deep Soil Mixing (DSM) columns within the building pad
- All corrective grading – i.e., minimum 2' bgs
- Construction of the cement-treated Load Transfer Platform (LTP) within the building pad.

To release each pad, a grading pad release letter will be prepared by GMU and submitted to the County of Orange. Subject to approval by the County of Orange, each pad can be incrementally released for trenching related to foundation construction. A building permit will need to be obtained prior to foundation construction. In addition, it should be noted that the final grading permit will not be signed off until all the precise grading is complete outside the building pads for all of the buildings (i.e., utility trench backfill, surface drainage, etc.)

TEMPORARY EXCAVATIONS

Temporary excavations for demolition, earthwork, footings, and utility trenches are expected. We anticipate that unsurcharged excavations with vertical side slopes less than or equal to 4 feet high will generally be stable; however, all temporary excavations should be observed by the contractor (primary responsibility) as well as a representative of GMU to verify the soil types and identify special conditions. Our preliminary recommendations for temporary excavations are as follows:

- OSHA Soil Types for Excavation Requirements:
  - Artificial Fill: Type C
  - Bedrock: Type B
- Additional Recommendations:
  - The tops of the excavations should be barricaded so that vehicles and storage loads do not encroach within 10 feet of the excavations. A greater setback may be necessary for heavy vehicles, such as concrete trucks and cranes. GMU should be advised of such heavy vehicle loadings so that specific setback requirements can be established.
  - If the temporary construction excavations are to be maintained during the rainy season, berms are recommended to be graded along the tops of the excavations in

Hadi Tabatabaee
BUILDING OFFICIAL

order to prevent runoff water from entering the excavation and eroding the slope faces.

- There is a potential for caving and collapse of sidewalls for excavations performed below groundwater. Proper lateral support and/or shoring should be implemented by the contractor based on the conditions exposed and as evaluated by GMU.

Our temporary excavation recommendations are provided only as **minimum** guidelines. All work associated with temporary excavations should meet the minimal safety requirements as set forth by CAL-OSHA. **Temporary slope construction, maintenance, and safety are the responsibility of the contractor.**

Although not anticipated, shoring may be required where the sides of the excavation cannot be sloped to the requirements provided in this report or as required by OSHA for the given soil types. Shoring design (if required) should be based on our geotechnical maps, cross sections, boring logs, and laboratory testing provided in this report. Shoring design performed by others should be reviewed by this office.

STRUCTURE SEISMIC DESIGN

Site-specific seismic design parameters were determined using the USGS computer program ASCE 7 Hazard Tool. The site coordinates used in the analysis were 33.46085° North Latitude and 117.69342° West Longitude. Based on our field exploration and the site soil profile, the site is designated as Site Class C. Seismic design coefficients based on ASCE 7-16 and the 2019 CBC are listed in table below.

2019 CBC and ASCE 7-16 Seismic Design Parameters

Hadi Tabatabaee
BUILDING OFFICIAL

It should be recognized that much of Southern California is subject to some level of damaging ground shaking as a result of movement along the major active (and potentially active) fault zones that characterize this region. Design utilizing the 2019 CBC is not meant to completely protect against damage or loss of function. Therefore, the preceding parameters should be considered as minimum design criteria.

COMMERCIAL BUILDINGS 1 AND 6-12 DESIGN RECOMMENDATIONS

Geotechnical Slab and Foundation Recommendations

General

Buildings 1 and 6 through 12 should founded on conventional foundations supported on DSM columns and a slab-on-grade supported on a blanket of cement-treated Load Transfer Platform (LTP). Please refer to the detail presented on the attached Plate 7 for DSM and LTP installation.

Slab Design

- Slab Support
    - Minimum 3-foot-thick section of cement-treated LTP or onsite soil underlain by 3-foot section of LTP. See previous “Corrective Grading” section (Page 17).
        - Subgrade compaction
            - 92% relative compaction
            - 1-3% over optimum moisture content for soil-cement mixture. 2% over optimum for onsite soil.
- Slab Type
    - Conventional
        - The minimum slab thickness and reinforcement provided below considers that the onsite soil consist of medium expansive soil and that the LTP will provide uniform support for the proposed slab.
    - Minimum Thickness
        - 5 inches
        - Final thickness to be determined by the structural engineer
    - Minimum Reinforcement
        - #4 bars at 16 inches o.c.
        - Final reinforcement to be specified by the structural engineer
- Moisture Retarder/Barrier
    - 15-mil Stegowrap or equivalent installed in strict compliance with the manufacture’s recommendations.

Foundation Design

- Footing Type
  - Conventional spread and continuous footings
- Footing Support – DSM
  - DSM columns extended into bedrock
  - Minimum 12 inches into bedrock or refusal, whichever occurs first, as verified under the observation or supervision of a Certified Engineering Geologist
  - Note: Groundwater should be anticipated during the deep soil mixing process. See Plate 5.
- Minimum Footing Size
  - Minimum dimensions
    - Width: 24 inches
    - Depth: 24 inches below lowest adjacent grade
- Allowable Bearing Value
  - 5,000 psf
  - As determined by AGI in their design document submitted under separate cover.
  - This value may be increased by 1/3 for short-term loadings such as seismic and wind.
- Preliminary Settlement Estimate
  - DSM
    - Static Total: 1 inch
    - Static Differential: 0.5 inch over a span of 40 feet
    - See AGI design submittal
  - Seismic Settlement
    - Total: 0.75 inch
    - Differential: 0.5 inch over a span of 40 feet
- Passive Resistance and Preliminary Friction Coefficient
  - Passive resistance: 300 psf/ft (engineered fill)
    - Disregard upper 6 inches
    - Maximum allowable of 3,000 psf
  - Friction coefficient: 0.35
  - 1/3 increase for temporary loads such as wind or seismic
- Concrete (Foundation and Slab)*
  - Type: II/V
  - Maximum water/cement ratio: 0.50
  - Minimum compressive strength of 4,000 psi

*See "**Structural Concrete**" section of this report (Page 29).

BUILDING OFFICIAL

COMMERCIAL BUILDINGS 2-5A and 5B DESIGN RECOMMENDATIONS

We understand that some of the buildings identified as Buildings 2 through 5 will be remodeled by removing and re-configuring some of the interior and exterior walls. As part of this remodel, new footings and re-construction of existing slab-on-grades are expected. Recommendations for new footings and slab-on-grade are presented below.

Slab Design

- Slab Support
  - Minimum 2-foot removal and recompaction
    - Subgrade compaction
      - 92% relative compaction
      - 2% over optimum moisture content
- Slab Type
  - Conventional
    - The minimum slab thickness and reinforcement provided below considers that the onsite soil consist of medium expansive soil and that the LTP will provide uniform support for the proposed slab.
  - Minimum Thickness
    - 5 inches
    - Final thickness to be determined by the structural engineer
  - Minimum Reinforcement
    - #4 bars at 18 inches o.c.
    - Final reinforcement to be specified by the structural engineer
- Moisture Retarder/Barrier
  - 15-mil Stegowrap or equivalent installed in strict compliance with the manufacturer's recommendations.

Foundation Design

- Footing Type
  - Conventional spread and continuous footings
- Footing Support – 2 feet of engineered fill
  - May consist of 2 feet of compacted onsite soil or
  - 2 feet of 2 sack sand cement slurry
- Minimum Footing Size
  - Minimum dimensions
    - Width: 18 inches
    - Depth: 24 inches below lowest adjacent grade

- Allowable Bearing Value
  - 2,500 psf
  - This value may be increased by 1/3 for short-term loadings such as seismic and wind
- Settlement Estimate
  - Static Total: 1 inch
  - Static Differential: 0.5 inch over a span of 40 feet
- Passive Resistance and Preliminary Friction Coefficient:
  - Passive resistance: 300 psf/ft (engineered fill)
    - Disregard upper 6 inches
    - Maximum allowable of 3,000 psf
  - Friction coefficient: 0.35
  - 1/3 increase for temporary loads such as wind or seismic
- Concrete (Foundation and Slab)*
    - Type: II/V
    - Maximum water/cement ratio: 0.50
    - Minimum compressive strength of 4,000 psi

*See "**Structural Concrete**" section of this report (Page 29).

NON-BUILDING MISCELLANEOUS STRUCTURES DESIGN RECOMMENDATIONS

The following recommendations pertain to non-building foundations supported on 2 feet of engineered fill in accordance with "Corrective Grading" section (Page 17). The design parameters presented below may be used for foundation structural design.

- Bearing Material
  - 2 feet of engineered fill
- Minimum Footing Size
  - Width: 18 inches
  - Depth: 24 inches embedment below lowest adjacent soil grade (depth)
- Allowable Bearing Capacity: 2,000 psf for the minimum footing size given above.
  - Above value may be increased by 1/3 for short-term loading such as wind or seismic
- Lateral Foundation Resistance
  - Allowable passive resistance: 300 psf/ft (disregard upper 6 inches, max 3,000 psf)
  - Allowable friction coefficient: 0.35
  - Above values may be combined without reduction and may be increased by 1/3 for temporary loads such as wind or seismic

SITE RETAINING WALLS DESIGN AND CONSTRUCTION

- Foundation Design
  - Minimum Foundation Width: 24 inches
  - Minimum Foundation Depth: Depth below lowest adjacent grade to bottom of footing: 24 inches
  - Bearing Materials: Minimum of 2 feet of engineered fill
  - Allowable Bearing Capacity: 2,000 psf for footing on level ground; may be increased 750 psf for each additional foot of width or depth to a maximum of 4,000 psf. (1/3 increase for wind or seismic)
  - Unit Weight of Backfill: 125 pcf
  - Lateral Foundation Resistance:
    - Allowable Passive Earth Pressure: 300 psf/ft of depth (static)
    - Coefficient of Friction: 0.35
    - Disregard upper 6 inches
    - May be increased 1/3 for seismic conditions
    - May be combined without resistance
  - Wall Design Parameters
    - Active Earth Pressure: 40 pcf – Assumptions: 1) level backfill; 2) select backfill; 3) back-drainage; and 4) wall movement > 0.01 H allowed.
    - Seismic Earth Pressure Walls > 6 feet: 17 pcf – triangular distribution
    - Weight of Backfill: 125 pcf
    - Control/Construction Joints: As a minimum, maximum spacing of 15 feet and at angle points (non-basement walls)
    - Waterproofing: The back side of all retaining walls should be waterproofed down to the top of the foundation prior to placing subdrains or backfill. The design and selection of the waterproofing system is outside the scope of our report and is outside our purview.
  - Concrete*: Type II/V cement (geotechnical perspective only)
    0.50 w/c ratio
    4,000 psi concrete

*See "**Structural Concrete**" section of this report (Page 29).

  - Low expansion
  - Subject to geotechnical approval

POLE FOUNDATION DESIGN RECOMMENDATIONS

Pole foundations will be required for the light bollards for the new parking areas. As a minimum, the pole foundations should be at least 18 inches in diameter and at least 4 feet deep; however, the actual dimensions should be determined by the project structural engineer based on the following design parameters.

- Bearing Materials: Engineered fill approved by a representative from GMU.
- Bearing Values: Allowable bearing pressure of 3,000 pounds per square foot (psf). At least 18 inches in diameter and embedded a minimum of 4 feet below the lowest adjacent grade.
- Lateral Load: Passive resistance of 300 pounds per foot of pile diameter per foot of depth into competent bearing material.

  Passive resistance should be disregarded within the upper foot due to possible disturbance during drilling. The passive resistance may be assumed to be acting over an area equivalent to two pile diameters.

STRUCTURAL CONCRETE

Laboratory tests indicate that the onsite soils in the general area of the site possess moderate levels of sulfate content or "S1" exposure per ACI 318-14, Table 19.3.1.1. Therefore, any structural features which will be in direct contact with the site soils at depth will have restrictions on the type of Portland cement, water to cement ratio, and the concrete compressive strength per ACI 318, Table 19.3.2.1 as follows:

- Type II/V cement with a maximum water to cement ratio of 0.50, and a minimum compressive strength of 4,000 psi (from a geotechnical perspective only).
- **NOTE: Any reinforced concrete elements that extend below the water table should be designed for C2 (Severe) exposure to moisture and chlorides, which consists of a maximum water to cement ratio of 0.40 and minimum compressive strength of 5,000 psi in accordance with ACI 318, Table 19.3.2.1.**

This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works. OC Development Services of Orange County. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

The aforementioned recommendations regarding concrete are made from a soils perspective only. Final concrete mix design is beyond our purview. All applicable codes, ordinances, regulations, and guidelines should be followed regarding designing a durable concrete with respect to the potential for sulfate exposure from the on-site soils and/or changes in the environment. Due to the potential for seawater exposure, the use of a corrosion engineer should be considered.

FERROUS METAL CORROSION

The results of the laboratory chemical tests performed on a sample of soil collected within the site indicate that the on-site soils are moderately corrosive to ferrous metals. In addition, some utilities may be planned below the groundwater table which may have elevated chlorides due to seawater. Consequently, metal structures which will be in direct contact with the soil (i.e., underground metal conduits, pipelines, metal signposts, etc.), in close proximity to the soil (wrought iron fencing, etc.), and/or below the groundwater table may be subject to corrosion.

The use of special coatings or cathodic protection around buried metal structures has been shown to be beneficial in reducing corrosion potential. Additional provisions will be required to address the high chloride contents of the soil or groundwater per the 2019 CBC to protect the concrete reinforcement. The laboratory testing program performed for this project does not address the potential for corrosion to copper piping. In this regard, a corrosion engineer should be consulted to perform more detailed testing and develop appropriate mitigation measures (if necessary).

The above discussion is provided for general guidance regarding the corrosiveness of the on-site soils to typical metal structures used for construction. Detailed corrosion testing and recommendations for protecting buried ferrous metal and/or copper elements are beyond our purview. If detailed testing is required, a corrosion engineer should be consulted to perform the testing and develop appropriate mitigation measures.

MOISTURE VAPOR TRANSMISSION

Moisture Vapor Retarder

A vapor retarder or barrier such as Stego 15 Mil Class A or equivalent should be utilized beneath the building slabs. The retarder/barrier should be installed as follows:

- Below moisture-sensitive floor areas.
- Installed per the manufacture's specifications as well as with all applicable recognized installation procedures such as ASTM E1643-98.

Building&Safety: Ryan Rose 12/11/2023
Approval: Geotechnical Reports

County of Orange - OC Public Works
OC Development Services
APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works. OC Development Services of Orange County. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

- Joints between the sheets and the openings for utility piping should be lapped and taped. If the barrier is not continuously placed across footings/ribs, the barrier should, as a minimum, be lapped into the sides of the footings/rib trenches down to the bottom of the trench.
- Punctures in the vapor barrier should be repaired prior to concrete placement.

A capillary break is not required. Also, sand and/or the amount of sand above the moisture vapor retarder should be specified by the owner. The selection of sand above the retarder is not a geotechnical engineering issue and is hence outside our purview.

Water Vapor Transmission Discussion

The placement of a moisture vapor retarder below all slab areas is recommended where moisture sensitive flooring will be placed. It should be noted that the moisture retarder is intended only to reduce moisture vapor transmissions from the soil beneath the concrete and is consistent with the current standard of the industry in building construction in Southern California. It is not intended to provide a "waterproof" or "vapor proof" barrier or reduce vapor transmission from sources above the retarder (i.e., concrete). Sources above the retarder include any sand placed on top of the retarder (i.e., to be determined by the project structural designer) and from the concrete itself (i.e., vapor emitted during the curing process). The evaluation of water vapor from any source and its effect on any aspect of the proposed building space above the slab (i.e., floor covering applicability, mold growth, etc.) is outside our purview and the scope of this report.

Floor Coverings

Prior to the placement of flooring, the floor slabs should be properly cured and tested to verify that the water vapor transmission rate (WVTR) is compatible with the flooring requirements.

SURFACE DRAINAGE

Surface drainage should be carefully controlled during and after grading to prevent ponding and uncontrolled runoff adjacent to building structures and/or other properties. Care will be required during grading to maintain slopes, swales, and other erosion control measures needed to direct runoff toward permanent surface drainage facilities. Positive drainage of at least 2% away from the perimeters of the structures and site pavements should be incorporated into the design. In addition, it is recommended that nuisance water be directed away from the perimeters of the structures using area drains in adjacent landscape and flatwork areas and roof drains tied into the site storm drain system.

INFILTRATION DESIGN CONSIDERATION

Based on our infiltration testing discussed in a previous section of this report, the installation of an infiltration facility such as an infiltration basin or trench within the subject site is not feasible from a geotechnical standpoint. On this basis, we recommend that one or more of the following Best Management Practices (BMPs) be considered:

- Rain gardens and dispersion trenches
- Bioretention areas and planters
- Permeable pavement
- Similar BMP's infiltrating over an extensive surface area and providing robust pretreatment or embedded treatment process.

Final selection of the type and location of BMP should be provided by the project civil engineer.

BIORETENTION AREAS

If bioretention features are installed, we recommend that an impermeable liner be installed at the bottom and sides of all bioretention areas to prevent vertical and lateral water migration into the adjacent structures and pavements. The design of bioretention basins above the liner is beyond our purview.

UTILITY DESIGN AND BACKFILL CONSIDERATIONS

Utility Design

Buoyancy

Utilities may be subject to buoyancy uplift forces. As a minimum, groundwater levels contained on Plate 5 should be assumed subject to the "notes" contained therein.

Additional Considerations

Site liquefaction may affect the utilities, pavements, and other site improvements. These improvements will be affected by total, regional differential, and local differential seismic settlements. In this regard, wherever possible, utilities should not be located under building slabs.

APPROVED
This set of plans and specifications must be kept on the job at all times. It is unlawful to make any changes or alterations to these plans without written permission from OC Public Works. OC Development Services of Orange County. The stamping of these plan specifications SHALL NOT be held to permit or be an approval of the violation of any provisions of any County Ordinance or State law.
Hadi Tabatabaee
BUILDING OFFICIAL

The following additional recommendations should also be considered.

- We recommend flexible PVC connections for the utilities connecting to the buildings, and earthquake shut-off valves for pressured utilities at their entrance to the site in accordance with SCWD standards.
- Significant repair and/or replacement will likely be required for all appurtenant structures and utilities in areas not mitigated for liquefaction, in the event of the design level earthquake.
- Any proposed cast iron piping should consider the corrosivity of the onsite soil in accordance with "Ferrous Metal Corrosion" section of this report (Page 30).

Utility Trench Backfill

General

New utility pipeline trenches should be backfilled with select bedding materials beneath and around the pipes and compacted soil above the pipe bedding where utilities are located above groundwater, and slurry backfill where utilities are placed below groundwater. Recommendations for the types of the materials to be used and the proper placement of these materials are provided in the following sections.

Pipe Bedding (Above Groundwater)

The pipe bedding materials should extend from at least 6 inches below the pipes to at least 12 inches above the crown of the pipes. Pipe bedding should consist of either clean sand with a sand equivalent (SE) of at least 30, or crushed rock. If crushed rock is used, it should consist of ¾-inch crushed rock that conforms to Table 200-1.2.1 (A) of the 2021 "Greenbook." Pipe bedding should also meet the minimum requirements of the County of Orange. If the requirements of the County are more stringent, they should take precedence over the geotechnical recommendations. Sufficient laboratory testing should be performed to verify the bedding meets the minimum requirements of the Greenbook and City of Dana Point and County of Orange grading codes.

Based on our subsurface exploration and knowledge of the onsite materials, the soils that will be excavated from the pipeline trenches will not meet the recommendations for pipe bedding materials; therefore, imported materials will be required for pipe bedding.

Granular pipe bedding material having a sand equivalent of 30 or greater should be properly placed in thicknesses not exceeding 3 feet, and then sufficiently flooded or jetted in place.

Crushed rock, if used, should be capped with filter fabric (Mirafi 140N, or equivalent) to prevent the migration of fines into the rock.

Hadi Tabatabaee
BUILDING OFFICIAL

Utility Trench Backfill (Above Groundwater)

All existing soil material within the limits of the pipeline alignment is considered suitable for use as trench backfill above the pipe bedding zone or above the slurry if care is taken to remove all significant organic and other decomposable debris, and moisture condition the soil materials as necessary.

Imported soils are not anticipated for backfill since the on-site soils are suitable. However, if imported soils are used, the soils should consist of clean, granular materials with physical and chemical characteristics similar to those described herein for on-site soils. Any imported soils to be used as backfill should be evaluated and approved by GMU prior to placement.

Soils to be used as trench backfill should be moistened, dried, or blended as necessary to achieve a minimum of 2% over optimum moisture content for compaction, placed in loose lifts no greater than 8 inches thick, and mechanically compacted/densified to at least 90% relative compaction as determined by ASTM Test Method D 1557. Jetting is not permitted in this trench zone.

No rock or broken concrete greater than 6 inches in maximum diameter should be utilized in the trench backfills.

Utility Trench Backfill (Below Groundwater)

Utilities that are planned below the groundwater elevation should be backfilled with 2 sack sand-cement slurry to at least 6 inches above the encountered groundwater. The backfill zone above the groundwater may consist of onsite soil or 2 sack sand-cement slurry. If onsite soil is used, it should be placed after the slurry has been allowed to cure for a minimum of 8 hours. The onsite soil should be placed in accordance with the above "Utility Trench Backfill (Above Groundwater)" section.

DSM / LTP Trench Backfill

Utility trench backfills that are planned within the proposed DSM columns and/or building LTP should consist of 2 sack sand-cement slurry regardless if the trenches are above or below groundwater.

PAVEMENT DESIGN RECOMMENDATIONS

General

It is expected that the driveways within the site will be constructed with both asphalt pavement and Portland cement concrete. Therefore, recommendations for both types of pavement areas are provided in the following sections. In order to accommodate fire truck and trash truck loadings, a traffic index (T.I.) of 5.5 has been assumed for the drive areas.

Hadi Tabatabaee
BUILDING OFFICIAL

Asphalt Pavement Design

Based on an anticipated R-value of 10, to be obtained after precise grading of asphalt pavement subgrade in the commercial area, the following pavement thicknesses should be anticipated:

Location	R-Value	Traffic Index	Asphalt Concrete (in.)	Aggregate Base (in.)
Car Parking Stalls	10	4.0	4.0	4.0
Drive Aisles	10	5.5	4.0	9.5
Drive Aisles/ Fire Lane	10	7.0	6.0	11.5

Based on our analyses and the provided T.I. of 7.0 for a fire lane, as determined by the project civil engineer, we note that the structural section provided above is adequate to support an occasional OCFA 94,000-pound fire apparatus.

Asphalt pavement structural sections should consist of:

- Crushed miscellaneous base (CMB) or crushed aggregate base (CAB) materials meeting the minimum County of Orange requirements.
- Asphalt concrete (AC) materials of a type meeting the minimum County of Orange requirements.
- The subgrade soils may consist of either onsite soils or recompacted spoils from the DSM and LTP construction, and should be moisture conditioned to a minimum 2% above the optimum moisture content to a depth of at least 6 inches and compacted to at least 92% relative compaction (per ASTM 1557).
- The CMB or CAB and AC should be compacted to at least 95% relative compaction (per ASTM 1557).

Portland Cement Concrete Pavement Design

Driveways, vehicular drives, and appurtenant concrete paving such as trash receptacle bays, will require Portland cement concrete (PCC) pavement. Assuming a T.I. of 6 to 7, a design section of 8 inches of PCC over 6 inches AB should be adequate. PCC vehicular pavement should be designed in accordance with the County of Orange standards.

- The subgrade soils may consist of either onsite soils or recompacted spoils from the DSM and LTP construction, and should be moisture conditioned to a minimum 2% above the optimum moisture content to a depth of at least 6 inches and compacted to at least 92% relative compaction (per ASTM 1557).
- The CMB or CAB should be compacted to at least 95% relative compaction (per ASTM 1557).

Hadi Tabatabaee
BUILDING OFFICIAL

TURF BLOCK PAVEMENT

We understand that Turf Block pavement is proposed on the project within some parking stalls and fire lanes adjacent to the proposed buildings. It is also our understanding that area drains will be installed within the turf blocks to direct water away from the turf block in order to avoid ponding and saturation of the underlying aggregate base material. Based on this, we have developed the following minimum recommendations for the turf block sections based on an assumed Traffic Index (T.I.) of 4.0 for parking stalls and 7.0 for fire lanes, and the tested R-value of 10 for the subgrade soil.

- Based on a T.I. of 4.0 for the parking stalls, we recommend that the proposed turf blocks be underlain by a 2-inch-thick leveling course of sand over 13 inches of Crushed Aggregate Base (CAB) or Crushed Miscellaneous Base (CMB).
- The turf block proposed within the fire lanes with a T.I. of 7.0 or less should be underlain by a 2-inch-thick leveling course consisting of sand over 22 inches of Crushed Aggregate base (CAB) or Crushed Miscellaneous Base (CMB).
- The CAB or CMB materials should meet current Greenbook and County of Orange requirements.
- The CAB or CMB should be placed at or above optimum moisture content and compacted to at least 95% relative compaction.
- The aggregate base should be underlain by a geofabric consisting of Mirafi 600x or equivalent placed over a properly prepared subgrade.

RECYCLED AC MATERIAL

The use of stockpiled, site-derived recycled AC and crushed miscellaneous base (CMB) material for new engineered fill subgrade, and CMB outside buildings and landscaped areas and under new asphalt concrete pavement and hardscape, will require GMU to conduct conformance laboratory testing on representative samples of the pulverized recycled materials to confirm that the samples meet the 2021 Greenbook Section 200-2.4 standards for Crushed Miscellaneous Base. GMU recommends that the recycled materials may be used as engineered fill for exterior subgrade structural support of new asphalt concrete and hardscape improvements outside of the building envelopes. The recycled materials are not to be used as compacted fill for support under any of the building areas or planters on the subject site.

Hadi Tabatabaee
BUILDING OFFICIAL

DISINTEGRATED GRANITE WALKWAYS

Due to the expansive nature of the on-site soils, we recommend that the subgrade for the Disintegrated Granite (DG) pedestrian walkways be moisture conditioned to 2% over optimum to a depth of 18 inches below finish grade and compacted to 90% relative compaction. A 4-inch-thick section of Class 2 aggregate base (AB) or crushed miscellaneous base (CMB) should then be placed on the compacted subgrade soils, brought to optimum moisture condition, and compacted to 95% relative compaction prior to placement of the DG. We recommend that the minimum section for the new DG pedestrian walkways consists of 4 inches of DG moisture conditioned to near optimum moisture content, and compacted to at least 90% relative compaction. The DG materials should be in conformance with Section 200-2.7 of the 2021 "Greenbook" Standard Specifications for Public Works Construction.

FLATWORK DESIGN RECOMMENDATIONS

We anticipate that the proposed improvements will be constructed on previously placed compacted fill material and will require minimum processing. However, prior to construction of flatwork/hardscape, we recommend that a 4-inch-thick layer of CMB material be incorporated below the proposed flatwork/hardscape. Spoils generated from the DSM and/or LTP may be used to achieve finish subgrade elevation for the proposed hardscape/flatwork as described in the "Corrective Grading" section of this report (Page 17). The flatwork table provided within Appendix F of this report may be utilized for integration of flatwork into the grading plans.

ROOT BARRIERS

Where new trees or large shrubs are to be located in close proximity to new concrete flatwork, rigid moisture/root barriers should be placed around the perimeter of the flatwork to at least 12 inches in depth in order to offer protection of the flatwork against potential root and moisture damage. Any flatwork near existing mature trees should also incorporate a rigid moisture/root barrier placed at least 2 feet in depth below the top of the flatwork.

PLAN REVIEW AND FUTURE SERVICES

PLAN REVIEW

Our office should review the final approved precise grading plans, DSM mitigation plans, and landscape plans for the site and comment on the anticipated effects of any major changes from the plans reviewed for this report. In addition, the final building foundation plans and final foundation loads will need to be reviewed to confirm that settlements are within tolerable limits.

FUTURE SERVICES

Construction Plan Review

GMU should review the final construction plans to confirm they are consistent with our recommendations provided in this report.

Geotechnical Testing During Grading and Construction

Given the complexity of the project, it is critical that geotechnical observation and testing is performed by GMU during the following stages of precise grading and construction:

- During site clearing and grubbing.
- During removal of any buried irrigation lines or other subsurface structures.
- During all phases of precise grading including over-excavation, temporary excavations, removals, scarification, ground preparation, moisture conditioning, proof-rolling, and placement and compaction of all fill materials.
- During installation of the DSM columns for the buttress and buildings.
- During grading for the cement treated load transfer platform.
- During installation of all foundations and floor slab elements.
- During backfill of underground utilities.
- During flatwork and paver section placement and compaction.
- During pavement section placement and compaction.
- When any unusual conditions are encountered.

LIMITATIONS

All parties reviewing or utilizing this report should recognize that the findings, conclusions, and recommendations presented represent the results of our professional geological and geotechnical engineering efforts and judgements. Due to the inexact nature of the state of the art of these professions and the possible occurrence of undetected variables in subsurface conditions, we cannot guarantee that the conditions actually encountered during grading and foundation installation will be identical to those observed and sampled during our study or that there are no unknown subsurface conditions which could have an adverse effect on the use of the property. We have exercised a degree of care comparable to the standard of practice presently maintained by other professionals in the fields of geotechnical engineering and engineering geology, and believe that our findings present a reasonably representative description of geotechnical conditions and their probable influence on the grading and use of the property.

Because our conclusions and recommendations are based on a limited amount of current and previous geotechnical exploration and analysis, all parties should recognize the need for possible revisions to our conclusions and recommendations during grading of the project. Additionally, our conclusions and recommendations are based on the assumption that our firm will act as the geotechnical engineer of record during grading of the project to observe the actual conditions exposed, to verify our design concepts and the grading contractor's general compliance with the project geotechnical specifications, and to provide our revised conclusions and recommendations should subsurface conditions differ significantly from those used as the basis for our conclusions and recommendations presented in this report.

Detailed corrosion testing and recommendations for protecting buried ferrous metal and/or copper elements are beyond our purview.

This report has not been prepared for use by other parties or projects other than those named or described herein. This report may not contain sufficient information for other parties or other purposes.

RETAINING WALL DETAIL
NOT TO SCALE

1. FINAL DETERMINATION OF THE MATERIAL TO BE USED FOR BACKFILL SHALL BE MADE BY GMU.
2. ALL SELECT BACKFILL TO WITHIN 1 TO 2 FEET OF FINAL GRADE SHOULD CONSIST OF FREE-DRAINING GRANULAR MATERIAL (I.E. SE 30 SAND, PEA GRAVEL, OR CRUSHED ROCK). CRUSHED ROCK, IF USED, SHOULD BE WRAPPED IN FILTER FABRIC (MIRAFI 140N OR EQUIVALENT) TO MINIMIZE THE POTENTIAL FOR MIGRATION OF FINES INTO THE ROCK. THE SELECT BACKFILL SHOULD BE MOISTURE CONDITIONED TO ACHIEVE OVER OPTIMUM MOISTURE CONTENT PER THE SOILS REPORT AND COMPACTED TO AT LEAST 90% RELATIVE COMPACTION AS DETERMINED BY ASTM TEST METHOD D 1557.
3. FINE-GRAINED NATIVE SOILS SHOULD BE USED TO CAP THE SELECT BACKFILL ZONE.
4. ALL NATIVE OR SELECT SOIL WALL BACKFILL SHOULD BE MOISTURE CONDITIONED AS NECESSARY TO OVER OPTIMUM MOISTURE CONTENT PER THE SOILS REPORT AND COMPACTED TO AT LEAST 90% RELATIVE COMPACTION AS DETERMINED BY ASTM TEST METHOD D 1557.
5. THE BACKSIDE OF THE WALLS SHOULD BE WATERPROOFED DOWN TO AND ACROSS THE TOP OF THE FOOTING. THE DESIGN AND SELECTION OF THE WATERPROOFING SYSTEM IS OUTSIDE OF THE PURVIEW OF GMU.
6. THE WATERPROOFING SYSTEM AND ANY DRAIN BOARDS SHOULD BE PROTECTED FROM DAMAGE BY CONSTRUCTION ACTIVITIES. THE TOP EDGE OF THE WATERPROOFING AND ANY DRAIN BOARDS SHOULD BE PROPERLY ADHERED TO THE WALL AND SEALED TO PREVENT THE POSSIBLE ACCUMULATION OF DEBRIS BETWEEN THE DRAINAGE/WATERPROOFING SYSTEM AND THE WALL.
7. THE BACKDRAIN SYSTEM SHOULD CONSIST OF 4" PERFORATED PIPE SURROUNDED BY AT LEAST ONE CUBIC FOOT OF 3/4"-1.5" OPEN GRADED GRAVEL WRAPPED IN MIRAFI 140 N FILTER FABRIC (OR EQUIVALENT). THE PERFORATED PIPE SHOULD CONSIST OF SDR-35 OR SCHEDULE 40 PVC PIPE (OR APPROVED EQUIVALENT) LAID ON AT LEAST 2" OF CRUSHED ROCK WITH THE PERFORATIONS LAID DOWN. THE BACKDRAIN GRADIENT SHOULD NOT BE LESS THAN 1% WHEN POSSIBLE. THE PERFORATED PIPE SHOULD OUTLET INTO AREA DRAINS OR OTHER SUITABLE OUTLET POINTS AT RUNS OF 200 FEET OR LESS, IF PRACTICAL. IF THE BACKDRAINS CANNOT BE OUTLETED BY GRAVITY FLOW, A SUMP PUMP SYSTEM WILL NEED TO BE DESIGNED AND CONSTRUCTED. REDUNDANT BACK-UP PUMPS OR COMPONENTS ARE RECOMMENDED. DESIGN OF THIS SYSTEM IS OUTSIDE OF THE PURVIEW OF GMU.
8. THE TIE-IN LOCATIONS FOR BACKDRAIN OUTLETS SHOULD BE SHOWN ON THE PRECISE GRADING, SITE WALL, AND/OR LANDSCAPE PLANS.

APPENDIX A

GMU GEOTECHNICAL EXPLORATION PROCEDURES AND LOGS

Our exploration at the subject site consisted of twenty-eight (28) drill holes and seven (7) Cone Penetration Test soundings (CPT). The estimated locations of the explorations are shown on Plate 2 – Geotechnical Map. Our drill holes were logged by a Staff Engineer, and drive, SPT, and bulk samples of the excavated soils were collected. "Undisturbed" samples were taken using a 3.25-inch outside-diameter drive sampler which contains a 2.416-inch-diameter brass sample sleeve 6 inches in length. Standard penetration testing (SPT) with a 2.0-inch outside-diameter split spoon sampler without liners was performed in the borings during advancement. Blow counts recorded during sampling from the drive sampler and SPT are shown on the drill hole logs. The logs of each drill hole are contained in this Appendix A, and the Legend to Logs is presented as Plate A-1 and A-2. The CPT logs are presented within Appendix A-3. Previous drill hole logs by GMU are presented within Appendix A-1. "Previous Boring Logs by Others" are presented within Appendix A-2, and "CPT Logs by Others" are presented within Appendix A-4.

The geologic and engineering field descriptions and classifications that appear on these logs are prepared according to Corps of Engineers and Bureau of Reclamation standards. Major soil classifications are prepared according to the Unified Soil Classification System as modified by ASTM Standard No. 2487. Since the descriptions and classifications that appear on the Log of Borings are intended to be that which most accurately describe a given interval of a boring, frequently an interval of several feet), discrepancies do occur in the Unified Soil Classification System nomenclature between that interval and a particular sample in that interval. For example, an 8-foot-thick interval in a log may be identified as silty sand (SM) while one sample taken within the interval may have individually been identified as sandy silt (ML). This discrepancy is frequently allowed to remain to emphasize the occurrence of local textural variations in the interval.

Boulders		>12"	>12"	Larger than a basketball
Cobbles		3-12"	3-12"	Fist-sized to basketball-sized
Gravel	Coarse	3/4-3"	3/4-3"	Thumb-sized to fist-sized
	Fine	#4-3/4"	0.19-0.75"	Pea-sized to thumb-sized
Sand	Coarse	#10-#4	0.079-0.19"	Rock-salt-sized to pea-sized
	Medium	#40-#10	0.017-0.079"	Sugar-sized to rock salt-sized
	Fine	#200-#40	0.0029-0.017"	Flour-sized to sugar-sized
Fines		passing #200	<0.0029"	Flour-sized and smaller

MOISTURE CONTENT

Dry- Very little or no moisture
Damp- Some moisture but less than optimum
Moist- Near optimum
Very Moist- Above optimum
Wet/Saturated- Contains free moisture

GMU

LEGEND TO LOGS

ASTM Designation: D 2487
(Based on Unified Soil Classification System)

APPENDIX B

GMU GEOTECHNICAL LABORATORY PROCEDURES AND TEST RESULTS

MOISTURE AND DENSITY

Field moisture content and in-place density were determined for each 6-inch sample sleeve of undisturbed soil material obtained from the drill holes. The field moisture content was determined in general accordance with ASTM Test Method D 2216 by obtaining one-half the moisture sample from each end of the 6-inch sleeve. The in-place dry density of the sample was determined by using the wet weight of the entire sample.

At the same time the field moisture content and in-place density were determined, the soil material at each end of the sleeve was classified according to the Unified Soil Classification System. The results of the field moisture content and in-place density determinations are presented on the right-hand column of the Log of Drill Hole and are summarized on Table B-1. The results of the visual classifications were used for general reference.

PARTICLE SIZE DISTRIBUTION

As part of the engineering classification of the materials underlying the site, samples were tested to determine the distribution of particle sizes. The distribution was determined in general accordance with ASTM Test Method D 422 using U.S. Standard Sieve Openings 3", 1.5", 3/4, 3/8, and U.S. Standard Sieve Nos. 4, 10, 20, 40, 60, 100, and 200. In addition, on some samples, a standard hydrometer test was performed to determine the distribution of particle sizes passing the No. 200 sieve (i.e., silt and clay-size particles). The results of the tests are contained in this Appendix B. Key distribution categories (% gravel; % sand, etc.) are contained on Table B-1.

ATTERBERG LIMITS

As part of the engineering classification of the soil material, a representative sample of the on-site soil material was tested to determine relative plasticity. This relative plasticity is based on the Atterberg limits determined in general accordance with ASTM Test Method D 4318. The results of these tests are contained in this Appendix B and also on Table B-1.

EXPANSION TESTS

To provide a standard definition of one-dimensional expansion, a test was performed on typical on-site materials in general accordance with ASTM Test Method D 4829. The result from this test procedure is reported as an “expansion index”. The results of this test are contained in this Appendix B and also on Table B-1.

CHEMICAL TESTS

The corrosion potential of typical on-site materials under long-term contact with both metal and concrete was determined by chemical and electrical resistance tests. The soluble sulfate test for potential concrete corrosion was performed in general accordance with California Test Method 417, the minimum resistivity test for potential metal corrosion was performed in general accordance with California Test Method 643, and the concentration of soluble chlorides was determined in general accordance with California Test Method 422. The results of these tests are contained in this Appendix B and also on Table B-1.

COMPACTION TESTS

Bulk samples representative of the on-site materials were tested to determine the maximum dry density and optimum moisture content of the soil. These compactive characteristics were determined in general accordance with ASTM Test Method D 1557. The results of this test are contained in this Appendix B and also on Table B-1.

DIRECT SHEAR STRENGTH TESTS

Direct shear tests were performed on typical on-site materials. The general philosophy and procedure of the tests were in accord with ASTM Test Method D 3080 - "Direct Shear Tests for Soils Under Consolidated Drained Conditions".

The tests are single shear tests and are performed using a sample diameter of 2.416 inches and a height of 1.00 inch. The normal load is applied by a vertical dead load system. A constant rate of strain is applied to the upper one-half of the sample until failure occurs. Shear stress is monitored by a strain gauge-type precision load cell and deflection is measured with a digital dial indicator. This data is transferred electronically to data acquisition software which plots shear strength vs. deflection. The shear strength plots are then interpreted to determine either peak or ultimate shear strengths. Residual strengths were obtained through multiple shear box reversals. A strain rate compatible with the grain size distribution of the soils was utilized. The interpreted results of these tests are shown in this Appendix B.

CONSOLIDATION TESTS

The one-dimensional consolidation properties of "undisturbed" native soil and bedrock samples were evaluated according to the provisions of ASTM Test Method D 2435. Sample diameter was 2.416 inches and sample height was 1.00 inch. Water was added during the test at approximate insitu normal loads to evaluate the potential for hydro-collapse and to produce saturation during the remainder of the testing. Consolidation readings were taken regularly during each load increment until the change in sample height was less than approximately 0.0001 inch over a two-hour period. The graphic presentation of consolidation data is a representation of volume change in axial load. As a result, both expansion and consolidation are

BUILDING OFFICIAL

illustrated. The results of the consolidation load tests are summarized in this Appendix B and Appendix B-1.

R-VALUE TESTS

Bulk samples representative of the underlying on-site materials were tested to measure the response of a compacted sample to a vertically applied pressure under specific conditions. The R-value of a material is determined when the material is in a state of saturation such that water will be exuded from the compacted test specimen when a 16.8 kN load (2.07 MPa) is applied. The results from these test procedures are reported in Appendix B-1 and also on Table B-1

APPENDIX B - LABORATORY TESTING

Diaz•Yourman & Associates (DYA) selected soil samples to be tested and the tests to be performed on the selected samples. Laboratory testing was performed by Hushmand Associates, Inc. Laboratory data are summarized on the boring logs in Appendix A and presented on Plates B1 through B14. We have reviewed and concur with the test results and accept full responsibility for their use in our analysis. A summary of the geotechnical laboratory testing is presented in Table B1. Corrosion potential test results are summarized in Table B2.

Table B1 - LABORATORY TESTING SUMMARY

TEST NAME	PROCEDURE	PURPOSE	LOCATION
Percent Passing the No. 200 Sieve	ASTM D1140-92	Classification, index properties	Boring Logs
Moisture Content, Dry Density	ASTM D2216-92	Classification, index properties	Boring Logs
Grain-Size Distribution	ASTM D422-63	Classification, index properties	Plate B1
Atterberg Limits	ASTM D-4318-93	Expansion potential, classification, index properties	Plate B2
Direct Shear	ASTM D3080-90	Shear strength	Plates B3 and B4
Compaction	ASTM D1557-91	Earthwork	Plates B5 and B6
Resistance (R-) Value	ASTM D2844-69 CTM 301	Pavement thickness design	Plates B7 through B10
pH	CTM 532	Corrosion potential	Plates B11 through B14 and Table B2

WATER TEMPERATURE CORRECTION FACTOR:	0.85
SAFETY FACTOR*:	2.25
UNFACTORED INFILTRATION RATE (IN/HR):	0.04
FACTORED INFILTRATION RATE (IN/HR):	0.02

Factor Category	Factor Description	Assigned Weight (w)	Factor Value (v)	Product (p) = w x v
Suitability Assessment	Soil assessment methods	0.25	3	0.75
	Predominant soil texture	0.25	2	0.5
	Site soil variablity	0.25	2	0.5
	Depth to groundwater	0.25	2	0.5
			Geotechnical Factor of Safety (SA):	2.25

Concern Level	Factor Value (v)
Low	1
Medium	2
High	3

Factor Description	High Concern	Medium Concern	Low Concern
Soil assessment methods	Use of borhole methods to estimate vertical infiltration rate (not recommended, but may be necessary at a planning level). Less than 2 tests per BMP	At least 2 tests per BMP. Use of borehole tests for dry wells or infiltration trenches. Use of infiltrometer or small scale PIT methods for vertical infiltration BMPs.	Extensive infiltration testing such as: PIT testing or infiltrometer testing at 3+ locations per BMP, and/or commitment to construction phase testing and design adaption if necessary.
Predominant soil texture	Silty and clayey soils with significant fines	Finer sandy soils with some loam content	Clean, granular soils (sands)
Site soil variablity	Highly variable soils indicated from site assessment or limited soil borings collected during site assessment.	Soil borings/test pits indicate moderately homogeneous soils.	Multiple soil borings/test pits indicate relatively homogeneous soils.
Depth to groundwater	Groundwater conditions or movement not well understood.	Seasonal high GW at least 10 ft below facility bottom.	Seasonal high GW at least 15 ft below facility bottom.

***Factor of safety should not be less than 2. Additional factor of safety in accordance with Table D-7 of the South Orange County Technical Guidance Document should be applied by the project civil engineer.**

WATER TEMPERATURE CORRECTION FACTOR:	0.85
SAFETY FACTOR*:	2.25
UNFACTORED INFILTRATION RATE (IN/HR):	0.05
FACTORED INFILTRATION RATE (IN/HR):	0.02

Factor Category	Factor Description	Assigned Weight (w)	Factor Value (v)	Product (p) = w x v
Suitability Assessment	Soil assessment methods	0.25	3	0.75
	Predominant soil texture	0.25	2	0.5
	Site soil variablity	0.25	2	0.5
	Depth to groundwater	0.25	2	0.5
			Geotechnical Factor of Safety (SA):	2.25

Concern Level	Factor Value (v)
Low	1
Medium	2
High	3

Factor Description	High Concern	Medium Concern	Low Concern
Soil assessment methods	Use of borhole methods to estimate vertical infiltration rate (not recommended, but may be necessary at a planning level). Less than 2 tests per BMP	At least 2 tests per BMP. Use of borehole tests for dry wells or infiltration trenches. Use of infiltrometer or small scale PIT methods for vertical infiltration BMPs.	Extensive infiltration testing such as: PIT testing or infiltrometer testing at 3+ locations per BMP, and/or commitment to construction phase testing and design adaption if necessary.
Predominant soil texture	Silty and clayey soils with significant fines	Finer sandy soils with some loam content	Clean, granular soils (sands)
Site soil variablity	Highly variable soils indicated from site assessment or limited soil borings collected during site assessment.	Soil borings/test pits indicate moderately homogeneous soils.	Multiple soil borings/test pits indicate relatively homogeneous soils.
Depth to groundwater	Groundwater conditions or movement not well understood.	Seasonal high GW at least 10 ft below facility bottom.	Seasonal high GW at least 15 ft below facility bottom.

***Factor of safety should not be less than 2. Additional factor of safety in accordance with Table D-7 of the South Orange County Technical Guidance Document should be applied by the project civil engineer.**

UNFACTORED INFILTRATION RATE (IN/HR):	0.29
FACTORED INFILTRATION RATE (IN/HR):	0.13

Factor Category	Factor Description	Assigned Weight (w)	Factor Value (v)	Product (p) = w x v
Suitability Assessment	Soil assessment methods	0.25	3	0.75
	Predominant soil texture	0.25	2	0.5
	Site soil variablity	0.25	2	0.5
	Depth to groundwater	0.25	2	0.5
			Geotechnical Factor of Safety (SA):	2.25

Concern Level	Factor Value (v)
Low	1
Medium	2
High	3

Factor Description	High Concern	Medium Concern	Low Concern
Soil assessment methods	Use of borhole methods to estimate vertical infiltration rate (not recommended, but may be necessary at a planning level). Less than 2 tests per BMP	At least 2 tests per BMP. Use of borehole tests for dry wells or infiltration trenches. Use of infiltrometer or small scale PIT methods for vertical infiltration BMPs.	Extensive infiltration testing such as: PIT testing or infiltrometer testing at 3+ locations per BMP, and/or commitment to construction phase testing and design adaption if necessary.
Predominant soil texture	Silty and clayey soils with significant fines	Finer sandy soils with some loam content	Clean, granular soils (sands)
Site soil variablity	Highly variable soils indicated from site assessment or limited soil borings collected during site assessment.	Soil borings/test pits indicate moderately homogeneous soils.	Multiple soil borings/test pits indicate relatively homogeneous soils.
Depth to groundwater	Groundwater conditions or movement not well understood.	Seasonal high GW at least 10 ft below facility bottom.	Seasonal high GW at least 15 ft below facility bottom.

***Factor of safety should not be less than 2. Additional factor of safety in accordance with Table D-7 of the South Orange County Technical Guidance Document should be applied by the project civil engineer.**

SAFETY FACTOR*:	2.25
UNFACTORED INFILTRATION RATE (IN/HR):	0.16
FACTORED INFILTRATION RATE (IN/HR):	0.07

Factor Category	Factor Description	Assigned Weight (w)	Factor Value (v)	Product (p) = w x v
Suitability Assessment	Soil assessment methods	0.25	3	0.75
	Predominant soil texture	0.25	2	0.5
	Site soil variablity	0.25	2	0.5
	Depth to groundwater	0.25	2	0.5
			Geotechnical Factor of Safety (SA):	2.25

Concern Level	Factor Value (v)
Low	1
Medium	2
High	3

Factor Description	High Concern	Medium Concern	Low Concern
Soil assessment methods	Use of borhole methods to estimate vertical infiltration rate (not recommended, but may be necessary at a planning level). Less than 2 tests per BMP	At least 2 tests per BMP. Use of borehole tests for dry wells or infiltration trenches. Use of infiltrometer or small scale PIT methods for vertical infiltration BMPs.	Extensive infiltration testing such as: PIT testing or infiltrometer testing at 3+ locations per BMP, and/or commitment to construction phase testing and design adaption if necessary.
Predominant soil texture	Silty and clayey soils with significant fines	Finer sandy soils with some loam content	Clean, granular soils (sands)
Site soil variablity	Highly variable soils indicated from site assessment or limited soil borings collected during site assessment.	Soil borings/test pits indicate moderately homogeneous soils.	Multiple soil borings/test pits indicate relatively homogeneous soils.
Depth to groundwater	Groundwater conditions or movement not well understood.	Seasonal high GW at least 10 ft below facility bottom.	Seasonal high GW at least 15 ft below facility bottom.

***Factor of safety should not be less than 2. Additional factor of safety in accordance with Table D-7 of the South Orange County Technical Guidance Document should be applied by the project civil engineer.**

Simplified Procedure for Estimating Earthquake Induced Deviatoric Slope Displacements
by Jonathan D. Bray and Thaleia Travasarou
Journal of Geotechnical and Geonvironmental Engineering, ASCE, V. 133(4), pp. 381-392, April 2007

SEE NOTES BELOW FOR GUIDANCE IN THE USE OF SPREADSHEET

Input Parameters			
Yield Coefficient (ky)	0.01		Based on pseudostatic analysis
Initial Fundamental Period (Ts)	0.0573	seconds	1D: Ts=4H/Vs 2D: Ts=2.6H/Vs
Degraded Period (1.5Ts)	0.09	seconds	
Moment Magnitude (Mw)	6.8		
Spectral Acceleration (Sa(1.5Ts))	1.385552	g	

Additional Input Parameters		
Probability of Exceedance #1 (P1)	84	%
Probability of Exceedance #2 (P2)	50	%
Probability of Exceedance #3 (P3)	16	%
Displacement Threshold (d_threshold)	30	cm

Intermediate Calculated Parameters			
Non-Zero Seismic Displacement Est (D)	150.84	cm	eq. (5) or (6)
Standard Deviation of Non-Zero Seismic D	0.66		

Results			
Probability of Negligible Displ. (P(D=0))	0.00		eq. (3)
D1	78.2	cm	calc. using eq. (7)
D2	150.8	cm	calc. using eq. (7)
D3	290.8	cm	calc. using eq. (7)
P(D>d_threshold)	0.99		eq. (7)

Notes

1. Values highlighted in blue are input parameters, and results are presented in the table with the yellow heading.
2. Probability of Exceedance is the desired probability of exceeding a particular displacement value.
3. Displacements D1, D2, and D3 correspond to P1, P2, and P3, respectively.
   (e.g., the probability of exceeding displacement D1 is P1)
4. The 16%, 50%, and 84% percentile displacement values at selected ky values are shown to the right.
5. Calculated seismic displacements are due to deviatoric deformation only (add in volumetrically induced movement).
6. ky may range between 0.01 and 0.5, Ts between 0 and 2 s, Sa between 0.002 and 2.7 g, M between 4.5 and 9
7. Rigid slope is assumed for Ts < 0.05 s
8. When a value for D is not calculated, D is < 1cm
9. ky may be estimated using the simplified equations shown below.
10. Examples of how Ts is estimated are shown below.
11. Vs = weighted avg. shear wave velocity for the sliding mass, e.g., for 2 layers, Vs = [(h1)(Vs1) + (h2)(Vs2)]/(h1 + h2)

Simplified Procedure for Estimating Earthquake Induced Deviatoric Slope Displacements
by Jonathan D. Bray and Thaleia Travasarou
Journal of Geotechnical and Geonvironmental Engineering, ASCE, V. 133(4), pp. 381-392, April 2007

SEE NOTES BELOW FOR GUIDANCE IN THE USE OF SPREADSHEET

Input Parameters			
Yield Coefficient (ky)	0.1		Based on pseudostatic analysis
Initial Fundamental Period (Ts)	0.0716	seconds	1D: Ts=4H/Vs 2D: Ts=2.6H/Vs
Degraded Period (1.5Ts)	0.11	seconds	
Moment Magnitude (M_W)	6.8		
Spectral Acceleration (Sa(1.5Ts))	1.519	g	

Additional Input Parameters		
Probability of Exceedance #1 (P1)	84	%
Probability of Exceedance #2 (P2)	50	%
Probability of Exceedance #3 (P3)	16	%
Displacement Threshold (d_threshold)	30	cm

Intermediate Calculated Parameters			
Non-Zero Seismic Displacement Est (D)	80.32	cm	eq. (5) or (6)
Standard Deviation of Non-Zero Seismic D	0.66		

Results			
Probability of Negligible Displ. (P(D=0))	0.00		eq. (3)
D1	41.7	cm	calc. using eq. (7)
D2	80.3	cm	calc. using eq. (7)
D3	154.8	cm	calc. using eq. (7)
P(D>d_threshold)	0.93		eq. (7)

Notes

1. Values highlighted in blue are input parameters, and results are presented in the table with the yellow heading.
2. Probability of Exceedance is the desired probability of exceeding a particular displacement value.
3. Displacements D1, D2, and D3 correspond to P1, P2, and P3, respectively.
   (e.g., the probability of exceeding displacement D1 is P1)
4. The 16%, 50%, and 84% percentile displacement values at selected ky values are shown to the right.
5. Calculated seismic displacements are due to deviatoric deformation only (add in volumetrically induced movement).
6. ky may range between 0.01 and 0.5, Ts between 0 and 2 s, Sa between 0.002 and 2.7 g, M between 4.5 and 9
7. Rigid slope is assumed for Ts < 0.05 s
8. When a value for D is not calculated, D is < 1cm
9. ky may be estimated using the simplified equations shown below.
10. Examples of how Ts is estimated are shown below.
11. Vs = weighted avg. shear wave velocity for the sliding mass, e.g., for 2 layers, Vs = [(h1)(Vs1) + (h2)(Vs2)]/(h1 + h2)

TABLE F - FLATWORK RECOMMENDATIONS
DANA POINT HARBOR – COMMERCIAL

Description	Subgrade Preparation	Minimum Concrete Thickness (Full)	Edge Thickness	Reinforcement (2)	Joint Spacing (Maximum)	Cement Type	Sulfate Resistance
Isolated Concrete Sidewalks and Walkways (4)	1) 2% over optimum to 12" (1), 2) 4" of CAB or CMB compacted to a minimum of 95% relative compaction above moisture conditioned subgrade.	4 inches	Per Landscape Architect	1) No. 3 bars at 24" o.c. if within 5' of top-of-slope conditions; otherwise not required, 2) where adjacent to curbs or structures and at cold joints/ expansion joints use dowels: No. 3 bars at 24" o.c. (5)	6 feet	II/V	(3)
Vehicular Concrete and Driveways	1) 2% over optimum to 12" (1), 2) 6" of CAB or CMB compacted to a minimum of 95% relative compaction above moisture conditioned subgrade.	8 inches	Per Landscape Architect	1) No. 3 bars at 24" o.c. (2) if within 5' of top-of-slope conditions; otherwise not required, 2) where adjacent to curbs or structures and at cold joints/ expansion joints use dowels: No. 3 bars at 24" o.c. (5)	6 feet	II/V	(3)
Concrete Interlocking Pavers (non-vehicular) (4,6)	1) 2% over optimum to 12"(1), 2) 13" of CAB or CMB compacted to a minimum of 95% relative compaction.	Not Required	Where adjacent to asphalt pavement and landscape areas - 4" of PCC over 4" of CAB or CMB compacted to a minimum of 95% relative compaction Min. 6" width	1) Thickened Edge: one No. 3 bar placed in long direction, 2) dowel into adjacent curbs or structures and across cold joints/ expansion joints w/No. 3 bars at 24" o.c. (5)	N/A	II/V	(3)
Concrete Interlocking Pavers (vehicular) (4, 6)	Subgrade: 2% over optimum to 12"(1) Parking Stall Access: 13 inches of CAB or CMB compacted to 95% relative compaction over Mirafi 600X or equivalent geotextile. Fire Access: 22 inches of CAB or CMB compacted to 95% over Mirafi 600X or equivalent.	Not Required	Where adjacent to asphalt pavements and landscape areas - 8" of PCC over 6" of CAB or CMB compacted to a minimum of 95% relative compaction Min. 6" width	1) Thickened Edge: one No. 3 bar placed in long direction, 2) dowel into adjacent curbs or structures and across cold joints/ expansion joints w/No. 3 bars at 24" o.c. (5)	N/A	II/V	(3)

(1) The moisture content of the subgrade must be verified by the geotechnical consultant prior to sand/rock placement.
(2) Reinforcement to be placed both ways and at or above the mid-point of the slab (i.e., a minimum of 2.0 to 2.5 inches above the prepared subgrade).
(3) Soils having moderate levels of sulfates as defined by CBC are expected. Concrete mix design shall be selected by the concrete designer. Concrete mix design is outside the geotechnical engineer's purview.
(4) Where concrete/ flatwork is adjacent a stucco surface, a ¼" to ½" foam separation/expansion joint should be used.
(5) If dowels are placed in cored holes, the core holes shall be placed at alternating in-plane angles (i.e., not cored straight into slab).
(6) Pavers to be installed per minimum manufacturers recommendations. *The minimum thickness of pavers should be 2 3/8" for pedestrian application and 3 1/8" for vehicular application, and should be installed per minimum manufacturer's recommendations, including min. 1" sand bedding. It is highly recommended that if vehicular pavers are to be constructed, they should maintain an aspect ratio of 3 to 1 or less (where the length of the paver is 3 times the thickness of the paver or less) in order to minimize edge cracking.*

General Note: Minor deviations to the above recommendations may be required at the discretion of the soils engineer or his representative.

This approval is based on the applicant's representation that the project will be constructed in accordance with the approved plans and specifications. Any deviations may require additional review and approval. It is the responsibility of the applicant to obtain all other required approvals prior to construction. Approval of this document does not authorize violation of any County Ordinance or State Law.
By: Ryan Rose
Building 1/1/24

PART 1 – GENERAL

1.1 SCOPE

A. DEEP SOILS MIXING (DSM) SHALL BE INSTALLED TO MITIGATE POTENTIAL FOR LATERAL SPREADING AND UNCERTAIN PERFORMANCE OF UNDOCUMENTED ARTIFICIAL FILL.

B. A LOAD TRANSFER PLATFORM (LTP) SHALL BE CONSTRUCTED THROUGHOUT ALL BUILDING FOOTPRINTS TO TRANSFER FLOOR SLAB LOADING TO UNDERLYING DSM COLUMNS AND PREVENT ADVERSE SETTLEMENT IN FLOOR SLAB AREAS THAT MAY RESULT FROM NEW LOADING APPLIED TO UNDERLYING UNDOCUMENTED ARTIFICIAL FILL.

C. THE DSM PLAN IS PREPARED IN ACCORDANCE WITH THE RECOMMENDATIONS OUTLINED IN THE GEOTECHNICAL REPORT PREPARED BY GMU DATED 5/27/2021.

D. THIS DESIGN IS BASED ON THE GEOTECHNICAL CHARACTERIZATION AND SOIL PARAMETERS PRESENTED IN THE REFERENCED GEOTECHNICAL REPORT, AS WELL AS LOAD REQUIREMENTS INDICATED ON THE STRUCTURAL DRAWINGS. THIS DESIGN WAS CONDUCTED IN A MANNER CONSISTENT WITH THE LEVEL OF CARE AND SKILL ORDINARILY EXERCISED BY MEMBERS OF THE GEOTECHNICAL ENGINEERING PROFESSION CURRENTLY PRACTICING UNDER SIMILAR CONDITIONS AND IN THE SAME LOCALITY. NO WARRANTY IS MADE NOR IMPLIED.

1.2 REFERENCES

A. GEOTECHNICAL INVESTIGATION REPORT, VOLUMES 1, 2, AND 3, DANA POINT HARBOR REVITALIZATION BUILDINGS 1 THROUGH 12, COMMERCIAL COMPONENT – REPORT NO. 17-206-02 PREPARED BY GMU DATED MAY 27, 2021.

B. ASTM C150 – SPECIFICATION FOR PORTLAND CEMENT

C. ASTM D1633 – STANDARD TEST METHODS FOR COMPRESSIVE STRENGTH OF MOLDED SOIL-CEMENT CYLINDERS

D. ASTM D4380 – DENSITY OF BENTONITE SLURRIES

F. FEDERAL HIGHWAY ADMINISTRATION DESIGN MANUAL: DEEP MIXING FOR EMBANKMENT, AND FOUNDATION SUPPORT, PUBLICATION NO. FHWA-HRT-13-046, OCTOBER 2013.

1.3 DEFINITIONS

A. DEEP SOIL MIXING (DSM) – A SOIL IMPROVEMENT TECHNIQUE USED TO CONSTRUCT IN SITU SOIL STRUCTURES OR TREAT SOILS IN PLACE, WITHOUT EXCAVATION OR DEWATERING. SOIL MIXING USES A LARGE, CRANE OR DRILL RIG – MOUNTED TURNTABLE TO INSERT A LARGE-DIAMETER (TYPICALLY 3- TO 8 -FOOT DIAMETER) TOOL INTO THE GROUND WHILE INJECTING AND MIXING A GROUT WITH THE SOIL. STABILIZED SOIL COLUMNS ARE CREATED THAT MAY BE JOINED TOGETHER BY OVERLAPPING TO FORM RETAINING WALLS OR FOUNDATION ELEMENTS, OR TO TREAT A LARGE BLOCK OF SOIL OR SLUDGE.

B. ASTM – ASTM INTERNATIONAL.

C. OWNER – THE OWNER AS REFERRED TO HEREIN IS DANA POINT HARBOR PARTNERS, LLC, C/O BURNHAM-WARD PROPERTIES.

D. ENGINEER – THE ENGINEER IS THE OWNER'S GEOTECHNICAL ENGINEER OF RECORD TO ACT ON ITS BEHALF IN THE EXECUTION OF THESE SPECIFICATIONS.

E. CONTRACTOR – REFERS TO THE GENERAL CONTRACTOR DIRECTLY CONTRACTED WITH THE OWNER AND SUBCONTRACTING THE DSM SCOPE TO THE DSM SUBCONTRACTOR.

F. DEEP SOIL MIXING SUBCONTRACTOR (DSM SUBCONTRACTOR) – AN INDIVIDUAL OR COMPANY WHO HAS HAD PROVEN AND SUCCESSFUL EXPERIENCE IN SOIL MIXING CONSTRUCTION.

G. GROUT – A STABLE COLLOIDAL SUSPENSION OF POWDERED CEMENT, BENTONITE, ADDITIVES AND/OR OTHER SIMILAR MATERIALS IN WATER. THE TERMS "GROUT" AND "SLURRY" ARE USED INTERCHANGEABLY IN THESE SPECIFICATIONS.

H. INJECTION RATIO – A VOLUMETRIC RATIO OF GROUT TO SOILS (E.G., 100 GALLONS/CUBIC YARD) TO BE MIXED IN A DSM COLUMN. THE GROUT INJECTION RATIO IS DETERMINED FOR EACH COLUMN BASED ON THE COLUMN DIMENSIONS, SOIL DENSITY, PATTERN OF TREATMENT, AND DESIRED APPLICATION RATE.

I. DSM COLUMN – ONE COMPLETED INSERTION, INJECTION AND MIXING OF THE SOIL WITH THE MIXING AUGER TO THE DESIGN DEPTH. THIS CREATES A COLUMN OF TREATED SOIL THE SAME DIAMETER AS THE MIXING AUGER. THE COLUMN MAY BE PRIMARY (THROUGH VIRGIN SOILS), SECONDARY (CONNECTING PRIMARY COLUMNS), TERTIARY, ETC.

J. WORKING PLATFORM – THE WORKING PLATFORM IS THE LEVELED AND STABLE SURFACE FROM WHICH THE DSM EQUIPMENT OPERATES.

K. MIXING AUGER/TOOL – THE SPECIAL TOOL THAT ATTACHES TO THE KELLY BAR AND IS INSERTED INTO THE GROUND TO MIX THE SOILS. THE TOOL MAY BE FITTED WITH PORTS FOR INJECTING GROUT, MIXING PADDLES, AUGER BLADES, ETC.

L. BLADE ROTATION NUMBER (BRN) – NUMBER OF BLADES X (RATE OF PENETRATION PLUS RATE OF WITHDRAWAL (IN REVOLUTIONS/METER). FOR EXAMPLE FOR 5 BLADES, RATE OF PENETRATION = 1 REVOLUTION/25 MM (40 REVOLUTIONS/M), AND RATE OF WITHDRAWAL = 1 REVOLUTION/20 MM (50 REVOLUTIONS/M), THE BRN = 5 X (40 + 50) = 450.

M. OBSTRUCTION – OBSTRUCTIONS ARE DEFINED AS MATERIALS CLASSIFIED AS UNDERGROUND UTILITIES, TREES (OR PARTS THEREOF), METAL, MAN-MADE OBJECTS, WOODEN/CONCRETE/STEEL OR ANY OTHER TYPE OF PILE OR DEEP FOUNDATION, OR NATURAL GROUND MATERIALS LARGER THAN A MAXIMUM COBBLE SIZE (8 INCHES MAXIMUM DIMENSION).

N. MIXING BLADE – A SINGLE MIXING BLADE SHALL CONSTITUTE A PAIR OF MIXING PADDLES ATTACHED TO THE SHAFT OF THE MIXING TOOL AT THE SAME ELEVATION. THE CUTTING PADDLES MAY ALSO BE CONSIDERED AS A MIXING BLADE.

O. DOSAGE – EXPRESSED AS THE MASS OF BINDER INTRODUCED PER VOLUME OF MIXED IN-SITU SOIL (E.G. KG/M^3).

1.4 SUBMITTALS

A. DSM WORK PLAN INCLUDING:

I. ASSIGNED NUMBER OF EACH COLUMN AS ID FOR INSTALLATION RECORD

II. NARRATIVE OF PLANNED MEANS AND METHODS TO EXECUTE THE INSTALLATION PER PLANS AND SPECIFICATIONS, INCLUDING SPECIFICATIONS OF THE GROUT BATCHING AND VERTICAL DRILL EQUIPMENT INTENDED FOR USE ON THE PROJECT.

III. NARRATIVE OF PLANNED MEANS AND METHODS TO EXECUTE THE QUALITY CONTROL REQUIREMENTS PER PLANS AND SPECIFICATIONS.

IV. PRELIMINARY SOIL MIX DESIGN INDICATING TYPE OF BINDER MATERIAL AND VOLUMETRIC PROPORTIONS FOR INITIAL TRIALS ON-SITE TO BE ADJUSTED BASED ON FIELD OBSERVATIONS AND EARLY STRENGTH RESULTS (SEE PART 3.2 TEST SECTION).

B. ACCURATE DAILY RECORDS OF THE WORK TO BE SUBMITTED BY CLOSE OF BUSINESS THE FOLLOWING DAY, INCLUDING:

I. COLUMN ID

II. DIAMETER

III. WORKING PAD ELEVATION

IV. MIXING DEPTH

V. START TIME

VI. TIME AT TIP ELEVATION

VII. FINISH TIME

VIII. MIXING DURATION

IX. GROUT MIX DETAILS (PERCENT WATER AND REAGENT BINDER)

X. GROUT INJECTION WITH DEPTH

XI. TOTAL INJECTED GROUT

XII. BLADE ROTATION NUMBER (BRN) WITH DEPTH

D. ANY PROPOSED CHANGE IN THE WORK PROCEDURES PLAN MADE NECESSARY BY CONDITIONS ENCOUNTERED DURING CONSTRUCTION FOR REVIEW AND APPROVAL BY THE ENGINEER.

E. MATERIAL CERTIFICATIONS FOR CEMENT BINDER TO BE USED IN THE PROJECT.

F. WEIGHTS: CERTIFICATES OF BATCH WEIGHTS FOR EACH TRUCK LOAD DELIVERED IF ON-SITE BATCH PLANT IS NOT USED.

G. ADMIXTURES/POZZOLANS/ADDITIVES SUBJECT TO THE APPROVAL OF THE ENGINEER, IF USED.

H. QC TEST RESULTS: SUBMIT ALL QC TEST RESULTS WITHIN 48 HOURS OF TESTING.

I. REPORT SUMMARIZING TEST SECTION RESULTS AND CALIBRATION OF DRILLING EFFORT CRITERIA FOR COLUMN DEPTH TERMINATION APPROVED BY THE ENGINEER.

J. AS-BUILT REPORT DOCUMENTING THE CONSTRUCTED LOCATIONS AND DIMENSIONS OF ALL DSM COLUMNS, COMPILATION OF ALL QUALITY CONTROL AND QUALITY ASSURANCE DATA COLLECTED FOR THE PROJECT, AND EXPLANATION OF ANY DEVIATION FROM THE PLANS AND SPECIFICATIONS PREVIOUSLY REVIEWED APPROVED TO THE SATISFACTION OF THE ENGINEER.

K. THE CONTRACTOR WILL SUBMIT A WORK PLAN DETAILING THE CONSTRUCTION AND QA/QC OF THE LTP, MEETING THE DESIGN REQUIREMENTS HEREIN AND IN THE GEOTECHNICAL REPORT.

1.5 ACCEPTANCE

A. ACCEPTANCE OF THE DSM WORK WILL BE BASED ON COMPLIANCE WITH THE STRENGTH AND GEOMETRY REQUIREMENTS OF THE PLANS AND SPECIFICATIONS AS VERIFIED BY THE ENGINEER'S QA TESTING. THE MATERIAL FORMED BY MIXING THE GROUT WITH THE IN SITU SOIL SHALL MEET A MINIMUM REQUIRED UNCONFINED COMPRESSIVE STRENGTH OF 150 POUNDS PER SQUARE INCH (PSI) AT 28 DAYS. TESTS WILL BE CONSIDERED PASSING IF THEY ARE AT LEAST 90% OF THE 150 PSI STRENGTH REQUIREMENT PROVIDED THAT NO MORE THAN 10% OF ALL TESTS FALL BELOW THE REQUIREMENT AND THE OVERALL AVERAGE STRENGTH EXCEEDS THE REQUIREMENT. IF THE UNCONFINED COMPRESSIVE STRENGTH RESULTS DO NOT MEET THAT CRITERIA, THE DSM SUBCONTRACTOR SHALL SUBMIT A MITIGATION PLAN FOR REVIEW AND APPROVAL BY THE ENGINEER.

PART 2 – PRODUCTS

2.1 MATERIALS

A. FRESH OR RECLAIMED WATER, FREE OF ANY DELETERIOUS SUBSTANCE THAT COULD ADVERSELY AFFECT THE GROUT PROPERTIES SHALL BE USED.

B. BINDER AGENT USED FOR THE PROJECT SHALL CONSIST OF PORTLAND CEMENT TYPE II/V CONFORMING TO ASTM DESIGNATION C150. THE CEMENT SHALL BE ADEQUATELY PROTECTED FROM MOISTURE AND CONTAMINATION WHILE IN TRANSIT AND STORAGE AT THE JOB SITE. RECLAIMED CEMENT OR CEMENT CONTAINING LUMPS OR DELETERIOUS MATTER SHALL NOT BE USED.

C. THE WATER AND CEMENT SHALL BE PREMIXED TO FORM A GROUT FOR INJECTION AND MIXING WITH THE IN-SITU SOIL. MATERIALS SHALL BE COMBINED IN PREDETERMINED WEIGHED PROPORTIONS WITH ITS QUALITY EVALUATED BY SPECIFIC GRAVITY MONITORED AT LEAST ONCE PER INSTALLATION BY MUD BALANCE.

D. THE DESIGN UNCONFINED COMPRESSIVE STRENGTH OF THE SOIL-CEMENT MATERIAL COMPRISING THE DSM COLUMNS IS 150 PSI AT 28 DAYS.

PART 3 – EXECUTION

3.1 EQUIPMENT

A. A PURPOSE BUILT HOLLOW STEM AND MIXING PADDLE TOOL ATTACHED TO A HIGH TORQUE ROTARY DRILL ON TRACKS SHALL BE USED TO ACCOMPLISH THE DSM. MIXING TOOLS OF 4- AND 6-FOOT-DIAMETER WILL BE IMPLEMENTED FOR THIS PROJECT. MIXING TOOLS SHALL CONSIST OF A MINIMUM OF FOUR (4) MIXING BLADES (4 PAIRS OF MIXING PADDLES).

B. CEMENT WILL BE STORED IN PURPOSE BUILT SILOS.

C. WATER SHALL BE MIXED WITH CEMENT IN A PURPOSE-BUILT WEIGH-BATCH MIXER TO PRODUCE SLURRY WITH A CONSISTENT SPECIFIC GRAVITY OR WATER:CEMENT RATIO FOR PROPER MIXING. JET VALVE MIXING OR OTHER CONTINUOUS MIXING METHODS WILL NOT BE ALLOWED.

D. GROUT SHALL BE DELIVERED TO THE MIXING RIG BY APPROPRIATELY SIZED POSITIVE DISPLACEMENT PUMPS. PROGRESSIVE CAVITY PUMPS SHALL NOT BE ALLOWED.

3.2 TEST SECTION

A. LOCATIONS: PRIOR TO INITIATING PRODUCTION WORK, DSM SUBCONTRACTOR SHALL INSTALL A MINIMUM OF TWO DSM COLUMNS WITH VARYING MIX DESIGN DOSAGE AT EACH OF THE SIX TEST SECTION LOCATIONS INDICATED ON THE PLANS.

B. EVALUATION GOALS: THE PURPOSE OF THE TEST SECTION IS TO EVALUATE THE FOLLOWING ITEMS PRIOR TO INITIATING PRODUCTION WORK. THE DSM SUBCONTRACTOR MAY PROCEED IMMEDIATELY TO PRODUCTION WHILE TEST SECTION EVALUATION RESULTS ARE PENDING BUT DOES SO AT ITS OWN RISK.

I. COLUMN DEPTH: COLUMN INSTALLATION DEPTHS FOR THE PROJECT ARE CONTROLLED BY THE DEPTH TO THE CAPISTRANO FORMATION CONTACT AS DESCRIBED IN SECTION 3.3.G. DURING TEST SECTION INSTALLATION ADJACENT TO EXISTING EXPLORATION DATA, DSM SUBCONTRACTOR SHALL MONITOR AND RECORD INDICATORS OF DRILLING EFFORT (E.G. ROTARY TORQUE APPLIED AND CROWD PRESSURE). DSM SUBCONTRACTOR SHALL PROPOSE A READILY IDENTIFIABLE METRIC SUBJECT TO THE ENGINEER'S APPROVAL FOR THE DRILL OPERATOR TO OBSERVE DURING INSTALLATION AS EVIDENCE OF ENCOUNTERING THE CAPISTRANO FORMATION.

II. MIX CONSISTENCY: DURING TEST SECTION MIXING THE DSM SUBCONTRACTOR AND ENGINEER SHALL OBSERVE

III. STRENGTH: A MINIMUM OF TWO WET-GRAB SAMPLES SHALL BE COLLECTED FROM EACH TEST SECTION COLUMN INSTALLED AT DEPTHS OF 1/3 AND 2/3 THE TOTAL INSTALLATION DEPTH. EACH SAMPLE COLLECTED SHALL BE CAST INTO CYLINDERS FOR UNCONFINED COMPRESSION STRENGTH TESTING AND EVALUATION AS DESCRIBED IN SECTION 3.4.B.

IV. LOAD TEST: DSM SUBCONTRACTOR SHALL CONDUCT A MINIMUM OF FOUR LOAD TESTS PER THE REQUIREMENTS OF THIS SPECIFICATION TO ASSESS THE 4-FOOT-DIAMETER DSM COLUMN GEOTECHNICAL CAPACITY ADJACENT TO EXPLORATORY TEST DATA. SEE PROPOSED LOAD TEST LOCATIONS ON SHEET GI-3.

3.3 CONSTRUCTION

A. INSTALL DSM COLUMNS AT THE LOCATIONS AND TO THE DEPTH INDICATED ON THE DSM PLAN.

B. HORIZONTAL ALIGNMENT: THE DSM COLUMNS SHALL BE CAREFULLY SURVEYED AND STAKED OUT PRIOR TO INSTALLATION. THE COLUMNS SHALL BE CONSTRUCTED WITHIN 4 INCHES OF THE LOCATIONS SHOWN ON THE DRAWINGS.

C. VERTICAL ALIGNMENT: VERTICAL ALIGNMENT OF THE AUGER STROKE WILL BE CONTROLLED BY THE EQUIPMENT OPERATOR. THE COLUMN VERTICALITY SHALL HAVE A TOLERANCE OF 1:50 MAXIMUM DEVIATION.

D. MIXING SHAFT SPEED: THE MIXING SHAFT SPEED (RPMS) SHALL BE ADJUSTED TO ACCOMMODATE AN ADEQUATE RATE OF MIXING SHAFT PENETRATION BASED ON THE DEGREE OF DRILLING DIFFICULTY. THE MIXING SHAFT SPEED CAN BE ADJUSTED ACCORDING TO DRILLING DIFFICULTY.

E. BOTTOM MIXING: THE BOTTOM OF THE COLUMNS SHALL BE DOUBLE MIXED BY RAISING THE MIXING SHAFTS FIVE FEET OFF THE BOTTOM AND THEN REINSERTING THEM FOR REMIXING.

F. GROUT TAKE: THE GROUT TAKE (OR INJECTION RATE) PER VERTICAL FOOT OF COLUMN WILL BE ADJUSTED TO THE REQUIREMENTS OF THE DESIGN MIX. APPROPRIATE DELIVERY PUMPS SHALL BE USED TO TRANSFER THE GROUT FROM THE MIX PLANT TO THE DSM RIG. A FLOW MONITORING DEVICE WILL BE INSTALLED IN THE GROUT LINE TO DETECT LINE BLOCKAGE AND ELECTRONICALLY RECORD INJECTION RATES AND VOLUMES VERSUS DEPTH AND TIME FOR QUALITY CONTROL MONITORING.

I. THE RATE OF APPLICATION MAY BE CONTROLLED AND MONITORED BY ADJUSTING THE PUMP OUTPUT TO THE PENETRATION RATE SO THAT A PRESET GROUT TAKE CAN BE ACHIEVED. TYPICALLY, THE APPLICATION RATE CAN BE SUCCESSFULLY CONTROLLED BY EXPERIENCED OPERATORS ONCE THE PATTERN OF OPERATION IS ESTABLISHED.

II. SOME VARIATIONS OF THE GROUT TAKE WILL OCCUR DUE TO FIELD CONDITIONS. HOWEVER, THE OVERALL APPLICATION RATE TO EACH STROKE CAN BE MONITORED, CALCULATED AND CONTROLLED. ADDITIONAL MIXING IS TO BE USED WHEN NECESSARY TO DISTRIBUTE THE GROUT THROUGH THE ENTIRE COLUMN. THE INJECTION OF GROUT TO EACH STROKE WILL BE MONITORED, CHECKED BY CALCULATION AND RECORDED.

G. COLUMN DEPTH:

I. BUTTRESS COLUMNS: COLUMNS INSTALLED FOR THE LATERAL SPREAD BUTTRESS SHALL BE INSTALLED TO A MINIMUM OF 4 FEET BEYOND THE CAPISTRANO FORMATION CONTACT AS IDENTIFIED BASED ON THE DRILLING EFFORT CALIBRATION PERFORMED DURING THE TEST SECTION WORK AND SUBJECT TO THE APPROVAL OF THE ENGINEER. PRACTICAL REFUSAL (AS DEFINED IN SECTION 3.3.H) ENCOUNTERED PRIOR TO ACHIEVING THE REQUIRED 4-FOOT EMBEDMENT INTO CAPISTRANO FORMATION MAY BE APPROVED BY THE ENGINEER ON A CASE-BY-CASE BASIS BUT THE DSM SUBCONTRACTOR SHALL BE PREPARED TO INITIATE PREDRILLING IF NEEDED TO ACHIEVE THE REQUIRED EMBEDMENT AT NO ADDITIONAL COST TO THE OWNER.

II. BUILDING SUPPORT COLUMNS: DSM COLUMNS INTENDED FOR SUPPORT OF THE RETAIL BUILDINGS SHALL BE INSTALLED TO A MINIMUM OF 1 FOOT BEYOND THE CAPISTRANO FORMATION CONTACT OR TO PRACTICAL REFUSAL. MEANS OF IDENTIFYING THE CAPISTRANO FORMATION CONTACT WILL BE BASED ON THE DRILLING EFFORT CALIBRATION PERFORMED DURING THE TEST SECTION WORK AND SUBJECT TO THE APPROVAL OF THE ENGINEER.

H. OBSTRUCTION/MIXING SHAFT PRACTICAL REFUSAL: IF OBSTRUCTIONS ARE ENCOUNTERED WHICH REDUCE THE RATE OF PENETRATION TO ONE FOOT PER MINUTE FOR TWO MINUTES UNDER FULL POWER, THE STROKE SHALL BE COMPLETED IN ACCORDANCE WITH THE SPECIFICATIONS AND REMEDIAL MEASURES WILL BE TAKEN. SUBCONTRACTOR SHALL NOTIFY CONTRACTOR TO INVESTIGATE, CONFIRM, AND REMOVE SAID OBSTRUCTIONS FROM THE SOIL MIXING AREA. ONCE CONTRACTOR REMOVES OBSTRUCTIONS AND BACKFILLS AND COMPACTS (IN LIFTS NOT TO EXCEED 3 FEET IN UNCOMPACTED THICKNESS) THE REMOVAL AREA WITH GRANULAR SAND OR SANDY GRAVEL MATERIAL, THE DSM SUBCONTRACTOR SHALL RETURN TO MIXING THE BACKFILLED AREAS AND REMAINING DSM COLUMNS PER PLANS AND SPECS. IF REMOVAL OF OBSTRUCTIONS BY CONTRACTOR DAMAGES A PREVIOUSLY INSTALLED DSM COLUMN, ASSOCIATED RE-INSTALLATION WORK SHALL BE COMPENSATED BY AS EXTRA AT THE CONTRACT UNIT PRICES. IF IT IS INFEASIBLE OR IMPRACTICAL TO CLEAR AN OBSTRUCTION FROM A DESIGN INSTALLATION LOCATION, CONTRACTOR MAY PROPOSE A MODIFICATION TO THE DESIGN PROVIDED THE ORIGINAL PERFORMANCE IS MAINTAINED SUBJECT TO THE REVIEW AND APPROVAL OF THE ENGINEER.

I. MIXING ENERGY: THE DSM SUBCONTRACTOR SHALL MIX EACH COLUMN WITH SUFFICIENT MIXING ENERGY THROUGHOUT TO PROPERLY PROCESS THE SOIL CEMENT PRODUCT. THE MIXING ENERGY SHALL BE DEMONSTRATED BY MEASURED AND RECORDED BRN REPORTED FOR EACH INSTALLATION AND THE MIXING ENERGY APPLIED SHALL MINIMALLY ACHIEVE THAT REQUIRED TO PRODUCE SATISFACTORY RESULTS DURING THE TEST SECTION.

J. NO EXCAVATION OR HEAVY GRADING BY CONTRACTOR SHALL PROCEED PRIOR TO 3 DAYS AFTER DSM COLUMN CONSTRUCTION UNLESS APPROVED BY THE DSM DESIGN ENGINEER.

K. UTILITY TRENCH: EXCAVATE THE COMPLETED DSM COLUMNS AS NECESSARY FOR UNDERGROUND UTILITIES. TRENCH BACKFILL WILL BE AS FOLLOW:

I. FOR TRENCHES CUT INTO BUTTRESS DSM AND ABOVE GWT: BACKFILL WILL NATIVE SOILS OR AS APPROVED BY THE ENGINEER.

II. FOR TRENCHES CUT INTO BUTTRESS DSM AND EXTEND BELOW GWT: BACKFILL WITH CEMENT SLURRY WITH COMPRESSIVE STRENGTH OF AT LEAST 300 PSI.

III. UTILITIES TRENCHES WILL AVOID CUTTING INTO THE DISCRETE 4' DIAMETER DSM COLUMNS SUPPORTING BUILDINGS AND SLABS.

L. MANAGEMENT OF SPOIL TO BE COORDINATED BETWEEN CONTRACTOR AND DSM SUBCONTRACTOR.

3.4 QUALITY CONTROL AND QUALITY ASSURANCE

A. PRIOR TO CONSTRUCTION, A PRELIMINARY MIX DESIGN SHALL BE GENERATED BY THE SUBCONTRACTOR. THE MIX DESIGN MAY BE OBTAINED BASED ON SITE SOILS AND LABORATORY TESTING, OR ALTERNATIVELY, BASED ON THE SUBCONTRACTORS DATABASE IN SIMILAR SOIL CONDITIONS AND STRENGTH REQUIREMENTS.

B. WET SAMPLING: THE DSM SUBCONTRACTOR SHALL OBTAIN WET BULK SAMPLES OF THE SOIL CEMENT MIX AND CAST IT IN CYLINDERS FOR SUBSEQUENT QUALITY CONTROL TESTING BY THE DSM SUBCONTRACTOR, AND QUALITY ASSURANCE TESTING AND ACCEPTANCE BY THE ENGINEER.

I. ONE SAMPLE WILL BE RETRIEVED PER WORK DAY PER RIG.

II. THE VOLUME OF SAMPLE RECOVERED DURING EACH SAMPLING SHALL BE SUFFICIENT TO CAST 6 SAMPLE CYLINDERS EACH MEASURING 3" DIAMETER BY 6" HIGH. A ½" SIEVE WILL BE USED TO SCREEN THE MATERIAL IN ORDER TO FACILITATE APPROPRIATE SCALING OF INCLUSIONS AND PROPER MODELING OF THE 3 INCH CYLINDERS.

III. OF THE 6 CYLINDERS CAST, 3 WILL BE PROVIDED TO THE ENGINEER FOR QUALITY ASSURANCE TESTING AND 3 WILL BE RETAINED BY THE DSM SUBCONTRACTOR FOR QUALITY CONTROL TESTING.

IV. TO AVOID DISTURBANCE, THE CYLINDERS ARE TO BE CURED ON SITE IN A COOLER WITH A SMALL AMOUNT OF WATER TO MAINTAIN A STABLE, COOL AND MOIST CURING ENVIRONMENT FOR 2 DAYS.

V. AFTER QUALITY ASSURANCE SAMPLES ARE RETRIEVED BY THE ENGINEER, ALL WET GRAB SAMPLES SHALL BE STORED IN A MOIST ROOM (NOT SUBMERGED) IN ACCORDANCE WITH ASTM C 192 UNTIL THE TEST DATE.

VI. THE QUALITY CONTROL SAMPLES WILL BE TESTED (BY THE DSM SUBCONTRACTOR) FOR UCS IN ACCORDANCE WITH ASTM D1633, AT 3-DAY, 7-DAY, AND 14-DAY AFTER CASTING. THE RESULTS WILL BE USED TO EXTRAPOLATE THE EXPECTED STRENGTH AT 28-DAYS.

VII. THE QUALITY ASSURANCE SAMPLES WILL BE TESTED (BY THE ENGINEER) FOR UCS IN ACCORDANCE WITH ASTM D1633, AT 7-DAY, 14-DAY, AND 28-DAY AFTER CASTING.

VII. WHEN TIME OR SCHEDULE DOES NOT PERMIT A 28-DAY CURING STRENGTH EVALUATION, THE FOLLOWING UCS AGING CORRELATION WILL BE TENTATIVELY APPLIED TO THIS JOB:

28 : 7 DAY, 1.57

VIII. THE ABOVE CORRELATION MAY BE ADJUSTED FOR SITE-SPECIFIC FINDINGS AS THE PROJECT DEVELOPS.

IX. THE DESIGN STRENGTH FOR THIS PROJECT AT 28-DAYS IS 150 PSI. SUBJECT TO THE APPROVAL OF THE ENGINEER, 7-DAY TEST RESULTS MAY BE ACCEPTED BASED ON THE CORRELATION ABOVE OR A REVISED CURING FACTOR BASED ON PROJECT-SPECIFIC STATISTICAL ANALYSIS OF AVAILABLE DATA.

C. LOAD TEST:

I. DSM SUBCONTRACTOR SHALL PERFORM A MINIMUM OF FOUR COMPRESSION LOAD TEST ON 4-FOOT-DIAMETER COLUMNS AT THE TEST SECTION LOCATION SPECIFIED FOR THE BUILDINGS ON THE DRAWINGS.

II. COMPRESSION LOAD TEST SHALL BE IN GENERAL ACCORDANCE WITH ASTM D1143. THE TEST COLUMN SHALL BE CONDUCTED TO AT LEAST 150% OF THE STATIC DESIGN LOAD.

III. LOAD TEST WILL NOT BE PERFORMED BEFORE THE COLUMN HAS ACHIEVED SUFFICIENT UNCONFINED COMPRESSIVE STRENGTH AS DEMONSTRATED BY LABORATORY TESTING ON WET GRAB SAMPLES.

D. OBSERVATION: A REPRESENTATIVE OF THE ENGINEER SHALL BE PRESENT FULL-TIME DURING ALL INSTALLATION WORK TO OBSERVE THE CONSTRUCTION OF THE DSM COLUMNS, SAMPLING, AND TESTING TO VERIFY THE DSM SUBCONTRACTOR PERFORMS THE WORK IN SUBSTANTIAL CONFORMANCE WITH THESE SPECIFICATIONS. THE ENGINEER SHALL MAINTAIN PARALLEL HAND RECORDS OF PERTINENT INSTALLATION DATA FOR COMPARISON WITH REPORTED INSTALLATION LOGS AND OBTAIN TEST SPECIMENS OF THE WET-SAMPLES COLLECTED FOR QUALITY ASSURANCE TESTING.
